ABSTRACT

Background: This study was carried out to find out the seropositive of HBV, HCV, HIV, Treponema pallidum and Malarial parasite among the blood donors attended at transfusion medicine department of DMCH in 2014. Our objective is to prevent the spread of Transfusion transmissible disease through blood transfusion and awareness of mass population about TTI.

Method: This study was carried out at transfusion medicine department of DMCH from 1st January 2014 to 31st December 2014. Total blood donors were 39,512. Blood donors of 18 - 60 years of both sexes were included in this study.

Results: Among 39,512 blood donors relative blood donors were 32,778(82.95 %), voluntary blood donors were 6734.( 17.04% Among 39,512 blood donors , HBsAg positive 456 (1.154%), Anti HCV positive 33(.090%), Malarial Parasite positive 04 (.010), Treponema pallidum positive 87 (.220%) and positive for HIV 01(.0025%) )

Conclusion: Prevention of spread of TTIs should be the main goal at the current time. It is important to follow the WHO guidelines to tests every donor for HBV, HCV, HIV and Syphilis to decrease the transmission of TTIs.

Key Words: Blood donor, Voluntary donor, Relative donor, Screening. TTI
The magnitude of the TTI varies from country to country depending on TTIs’ loads in that particular population from where blood units are sourced. Multiple measures are taken to minimize TTI transmission in the respective population. The majority of the problems are due to the prevalence of asymptomatic carriers in the society, as well as blood donations during the window period of infections. There is a long list of viruses, parasites, and bacteria, which can be transmitted through blood transfusions. Among them, important transfusion transmitted viruses are human immunodeficiency virus (HIV-I/II), hepatitis B virus (HBV), hepatitis C virus (HCV), syphilis infection by Spirochaetes, and transfusion associated malaria infection “as discussed by Choudhury.17

**Methodology**

This study was carried out at transfusion medicine department of DMCH from 1st January 2014 to 31st December 2014. Among total 39,512 blood donors, relative donors were 32,778 and remaining 6,734 donors were voluntary donors. Donors were selected after proper history taking and physical examination, according to donor selection criteria. With all aseptic precaution blood collected from donors. Centrifuged the blood and separated the serum another labeled test tube. Detection of HBsAg, Anti-HCV, Anti-HIV, Anti-Treponema and Anti-Malaria were done by rapid device and positive tests were repeated by ELISA. All tests were performed in accordance with the instruction of reagent manufacture.

**Results**

In this study among 39,512 blood donors, relative blood donors were 32,778 (82.95 %) and voluntary blood donors were 6734. (17.04 %) Among total blood donors male and female were 31602 (79.98 %) and 7910 (20.01 %) respectively. Age ranges of donors were 18 -40 years 35,275 (89.27 %) and 41 -60 years 4,237 (10.72 %). Frequency of HBsAg positive 456 (1.154 %), Anti HCV positive 33 (.090 %), Malarial Parasite positive 4 (.010 %), Treponema pallidum positive 87 (.220 %) and positive for HIV 1(.00253 %)

**Discussion**

In this study among 39,512 blood donors, relative blood donors were 32,778 (82.95 %) and voluntary blood donors were 6,734. (17.04 %) Among total blood donors male and female were 31602 (79.98 %) and 7910 (20.01 %) respectively. Age ranges of donors were 18 -40 years 35,275 (89.27 %) and 41 -60 years 4,237 (10.72 %). Frequency of HBsAg positive 456 (1.154 %), Anti HCV positive 33 (0.90 %), Malarial Parasite positive 4 (0.10 %), Treponema pallidum positive 87 (0.22 %) and positive for HIV 1(0.00253 %).

In Bombay, HbsAg positive in 6% cases and in Pakistan it is 5%. In one study done by Safe Blood Transfusion Center, HbsAg positive (0.96%), HCV positive (0.15%), HIV positive 0.0065% TP positive (0.15%) 4. Study in KMCH. HbsAg positive (1.39%), HCV positive (0.024%), HIV positive (0.38%) 5. In a study in Canada, HbsAg positive (12.40%), HCV positive (16.83%), HIV positive (0.38%) 6. In a study in
Italy HBV positive is (4.86%)\textsuperscript{7}. In another in Turkey, HBV positive (1.38%), HCV (0.35%)\textsuperscript{8}.

Seroprevalence rates of HBsAg and anti-HCV varies different countries. Prevalence of HBsAg was found 3.4% in Georgia, 1.5% in Kingdom of Saudi Arabia, 4.3% in Egypt, 1.38% in Turkey, 0.82% in Nepal and 3.3% in Brazil\textsuperscript{9-10}. A similar study was conducted in India which depicted that the prevalence rates of TTI per 100000 donations were 350 for HIV (0.35%), 350 for HCV (0.35%), 1660 for HBV (1.66%) and 800 for syphilis (0.8%)\textsuperscript{11}. It was noted that in Ethiopia the prevalence rates of TTIs in blood donors are 4.5% for HIV, 8.2% for HBV and 5.8% for HCV\textsuperscript{12}. In Iranian blood donors these rates were 0.003%, 0.487%, 0.093% and 0.005% for HIV, HBV, HCV and Syphilis respectively\textsuperscript{13}.

**Conclusion**

The field of transfusion medicine has encountered huge precautions in providing safe blood. Prevention of spread of TTIs should be the main goal at the current time. It is important to follow the WHO guidelines to tests every donor for HBV, HCV, HIV and Syphilis to decrease the transmission of TTIs. Voluntary donors should be promoted and their screening should be made mandatory at each health care facility. Educating people and creating awareness about voluntary blood donation is an important factor.
