Keywords: Angiosperm diversity; Teknaf wildlife sanctuary; Bangladesh.

Abstract

Teknaf Wildlife Sanctuary has been explored to assess angiosperm diversity using traditional taxonomic techniques during 2010 to 2011. The assessment has resulted in recording of total 535 angiosperm species under 103 families and 370 genera. For each species scientific name, Bangla name (whenever available), family and habit are provided. Of 535 species, 178 represented by herbs, 110 by shrubs, 150 by trees, 87 by climbers and 10 by epiphytes. In Magnoliopsida (dicots), Fabaceae is the largest family represented by 38 species, while in Liliopsida (monocots), Poaceae is the largest family represented by 29 species.

Introduction

Teknaf Wildlife Sanctuary, previously declared as game reserve in 1983 under the Bangladesh Wildlife (Preservation) (Amendment Act, 1974), is located in the Teknaf and Ukhia Upazilas of Cox's Bazar district near Myanmar border. Geographical position of the reserve is in between $20^{\circ}52''$ - $21^{\circ}09''$ N and $92^{\circ}08''$ - $92^{\circ}18''$ E (Rosario, 1997). The Reserve is bordered by the Bay of Bengal to the south and west, the Naf River to the east and Monkhali and Thainkhali to the north. The reserve is locally managed by three range offices (Teknaf, Whykhong and Shilkhali ranges) and ten forest bits. The total area of the reserve is about 11651 ha (Green, 1987).

Teknaf wildlife sanctuary in past supported mixed evergreen and semi-evergreen forests which over the period have been substantially altered due to heavy biotic pressure. The topography of sanctuary is very undulating and covered with a linear hill range (elongation north to south reaching an altitude up to 700 m), gently sloping to rugged hills and cliffs running down the central part of the peninsula, with a north-south length of nearly 28 km and an east-west width of 3-5 km. The range has several projections running towards east and west and interspersed by valleys, gullies and streams. These are crossed by numerous streams flowing down to the Naf river in the east and the Bay of Bengal in the west. Most of the streams are seasonal and dry up during off-monsoon season. The hills of the Sanctuary are composed of upper tertiary rocks (Pliocene and Miocene epoch) with 3 representative geological series: Surma, Tipam and Dhupitila (Choudhury, 1969). The soils vary from clay to clayey loam on level ground, and from sandy loam to coarse sand on hilly land (Choudhury, 1969). The sanctuary area enjoys a moist tropical maritime climate and rainfall is frequent and heavy during the monsoon season (May to October) ranging between 130 mm to 940 mm. Temperature ranges from 15°C to 32°C, whereas humidity ranges from 27% to 99% (BBS, 2011).

As the Government commitment to the Convention on Biological Diversity (CBD), Taxonomists have already started to assess and document the floral diversity of different protected areas of Bangladesh. There are a few reports available on the Teknaf Wildlife Sanctuary. A list of

¹Corresponding author, Email: zashim07@yahoo.com

²ACF, Teknaf Wildlife Sanctuary

important timber yielding plants of the Teknaf game reserve has been mentioned in the forestry master plan of Cox's Bazar south division (Cowan, 1923). Many years later, Khan *et al.* (1994) has made an assessment work on Teknaf game reserve to focus on ecologically and economically important plant species. Although co-management issues of Teknaf game reserve have been studied by several authors (Bari and Dutta, 2004; Molla *et al.*, 2004), little is known about the floral diversity of the sanctuary. The sanctuary is very rich in flora and represents different ecosystems including hill forest, mangrove formation and sanddune. Conservation significance of the sanctuary is also high because of the presence of Asian threatened elephant population. Currently floral diversity of the sanctuary is under threat due to various pressure including anthropogenic activities and the presence of Rohingya refugee along the eastern border. For making proper conservation and management plans of the sanctuary before its complete degradation, data on the floral diversity is essential. In order to provide such information, in the present study an attempt has been made to document diversity of angiosperm flora of Teknaf Wildlife Sanctuary.

Materials and Methods

Specimen collections have been made in the Teknaf wildlife sanctuary at 2-months intervals between November 2010 and December 2011. The collections covered all habitats of the study area including hilltops, slopes, foothills, valleys, sand dune and wet areas including mangrove stretch along the Naf river. Special attention has been given to locate the species already listed as threatened categories in the country. Fertile plant specimens (flowering or fruiting specimens) were collected and processed using standard herbarium techniques (Hyland, 1972; Alexiades, 1996). The plant specimens were identified by consulting different Floras and literature, *viz.*, Hooker (1872-1897), Prain (1903), Uddin and Hassan (2004), Siddiqui *et al.* (2007) and Ahmed *et al.* (2008a, 2009a), and by comparing with the herbarium specimens available at Dhaka University Salar Khan Herbarium (DUSH) and Bangladesh National Herbarium (DACP). For updated nomenclature of the species, Siddiqui *et al.* (2007) and Ahmed *et al.* (2008a,b, 2009a,b,c) were followed. Threatened categories of plants were confirmed with the help of Khan *et al.* (2001). Some noxious exotic plant species were also identified comparing with the reports of Islam *et al.* (2003), Hossain and Pasha (2004) and Akter and Zuberi (2009). Cronquist (1981) system of classification has been followed to determine the families. Voucher specimens are deposited at DUSH.

Results and Discussion

A total of 535 angiosperm species (wild and cultivated) have been identified and presented based on the present study (collection and observation) in the Teknaf Wildlife Sanctuary. These species have been assigned to 103 families and 370 genera. For each species scientific name, Bangla name (when available) and family name are provided (Table 1). 46% of the total species are represented by 15 families, whereas the rest 54% by 87 families. In Magnoliopsida (dicots) Fabaceae is the largest family represented by 38 species, while in Liliopsida (monocots) Poaceae is the largest family represented by 29 species. Each of 31 families is represented by only one species. Of 535 species recorded here, herbs are represented by 178 species, 110 by shrubs, 150 by trees, 87 by climbers and 10 by epiphytes including parasites. Nineteen species including one gymnosperm (*Gnetum oblongum*) listed as threatened in the Red Data Book of the country have also been detected in this sanctuary (Khan *et al.*, 2001).

Once, the Teknaf area has been classified as hill forest dominated by evergreen and deciduous trees. Currently maximum area of the forest has been degraded and denuded and exposed to sun.

In such a situation some natural and planted forest covers have been observed in Shilkhali, Shaplapur, Kudumgoha and Muchani along the road to Teknaf range office. The most common first canopy tree species observed in this area are *Dipterocarpus turbinatus* (Teliagarjan), *D. alatus* (Duliagarjan,) *Hopea odorata* (Telsur), *Artocarpus chaplasha* (Chapalish), *Tetrameles nudiflora* (Chundul), *Anisoptera scaphula* (Bailum), *Syzygium firmum* (Dhakijam), *Mangifera sylvatica* (Uriam) and *Swintonia floribunda* (Civit). The second storey is dominated by *Bursera serrata*, *Artocarpus lakucha*, *Brownlowia alata*, *Anogeissus acuminata*, *Alstonia scholaris*, *Albizia procera*, *Neolamarckia cadamba*, *Ficus altissima*, *Syzygium cumini*, *Terminalia bellirica*, *Garuga pinnata*, *Elaeocarpus floribunda*, *Lagerstroemia speciosa*, *Toona ciliata*, *Dillenia pentagyna*, *Aphananixis polystachya*, *Gmelina arborea*, *Zanthoxylum rhetsa*, *Quercus velutina*, *Stereospermum personatum*, *Vitex peduncularis*, *Sterculia villosa*, *Bombax insigne*, *Anacardium occidentale* and *Ficus infectoria*. The third storey of the forest is dominated by *Syzygium fruticosum*, *Suregada multiflora*, *Streblus asper*, *Grewia microcos*, *Mallotus philippensis*, *Litsea glutinosa*, *Pterospermum semisagittatum*, *Tabernaemontana recurvata*, *Erioglossum edulis*, *Glochidion multiloculare*, *Saraca indica*, *Callicarpa arborea*, *Ficus hispida*, *F. semicordata*, *Maesa indica*, *Flacourtie indica*, *Micromelum minutum*, *Phyllanthus reticulatus*, *Pterospermum semisagittatum*, *Premna esculenta*, *Dalbergia volubilis*, *Randia dumetorum*, *Woodfordia fruticosa*, *Litsea monopetala* and *Antidesma ghaesembilla*.

The most common species found as the forest undergrowth are mostly the members of Acanthaceae, Araceae, Asteraceae, Cyperaceae, Eupobiaceae, Fabaceae, Poaceae, Rubiaceae and Zingiberaceae. In the degraded area of the hills where tree cover is almost absent, the most common species are *Clerodendrum viscosum*, *Chromolaena odorata*, *Mimosa pudica*, *Urena lobata*, *Melastoma malabathricum*, *Borreria hispida*, *Triumfetta rhomboidea*, *Ixora javanica*, *Ageratum conyzoides*, *Mikania cordata*, *Osbeckia asperculis*, *Globba multiflora*, *Desmodium triquetrum*, *Crotalaria juncea*, *Leea crispa*, *Sida acuta*, *Ocimum americanum*, *Hyptis sauveolens* and also some members of common climber families including Dioscoreaceae, Combretaceae, Vitaceae, Convolvulaceae, Menispermaceae, Apocynaceae, Asclepiadaceae and Cucurbitaceae. Relatively wet areas are dominated by *Hydroleia zeylanica*, *Ludwigia adscendens*, *Ipomoea aquatica*, *Alternanthera sessilis*, *Tilanthera philoxeroides*, *Monochoria vaginalis*, *Colocasia esculenta*, *Hedyotis scandens*, *Eichhornia crassipes*, and also the member's sedge, grass, aroids.

In the edge of forest and on the bank of streams the most common climbers are *Mikania cordata*, *Ichnocarpus frutescens*, *Merremia umbellata*, *Calycopteris floribunda*, *Derris trifoliata*, *Thunbergia grandiflora*, *Cyclea barbata*, *Cissus adnata*, *Cayratia japonica*, *Stephania harnadifolia*, *Combretum apetalum*, *Acacia concinna*, *Vitis repens*, *Bridelia secundens*, *Smilax zeylanica*, *Dioscorea pentaphylla*, *Dioscorea bulbifera*, *Hoya parasitica* and *Argyreia capitiformis*. Large canopy trees are special habitats for epiphyte and parasites. The most common epiphytes are *Aerides odorata*, *Bulbophyllum lilacinum*, *Cymbidium aloifolium*, *Dendrobium aphyllum*, *Luisia zeylanica*, *Vanda teres*, *Pholidota imbricata* and *Rhynchostylis retusa*. One threatened Gymnosperm *Gnetum oblongum*, is also observed in the area. The most common planted species observed in the area are *Acacia auriculiformis*, *Acacia mangium*, *Tectona grandis*, *Gmelina arborea*, *Syzygium grandis*, *Terminalia arjuna*, *Aquilaria agallocha* and *Dipterocarpus turbinatus*. The common bamboo species are *Bambusa tulda* and *Melocanna baccifera*. Among rattans *Calamus erectus* and *C. longisetus* are found in the forest. In the homestead gardens, common trees are *Artocarpus heterophyllus*, *Mangifera indica*, *Areca catechu*, *Borassus flabellifer*, *Carica papaya*, *Citrus grandis*, *Cocos nucifera* and *Psidium guajava*.

The sanctuary also covered a narrow strip of mangrove vegetation at the eastern face of the hill range towards Naf river. Such vegetation is dominated by *Aegialitis rotundifolia*, *Avicennia officinalis*, *Sonneratia apetala*, *Dalbergia spinosa* and *Acanthus ilicifolius*. Rare occurrence of *Heritiera fomes*, *Aegiceras corniculata* and *Bruguiera gymnorhiza* are also recorded in the area. A small patch of *Nypa fruticans* vegetation has been observed in north corner of mangrove strip vegetation. Tiger fern is also observed in the area. In the western side of hill range a special habitat called sand dune is located and the most common species are *Ipomoea pes-caprae*, *Vitex trifolia* and *Pandanus foetidus*.

During the field observations and discussion with foresters and local people, we could identify a number of threats to plant diversity. These are illegal logging, political influence in illegal logging and encroachment, Rohingya pressure, bribe in sanctuary area, cutting of plantlets for betel leaf cultivation, new road construction, fragmentation, over ambitious foresters, inadequate manpower in the forest department in terms of forest area and minor products collections including fire wood. All such threats are enough to eliminate remaining plant diversity from the sanctuary.

For the sustainable conservation of angiosperm diversity in Teknaf wildlife sanctuary, the following recommendations have been made. Database for all species need to be made first, otherwise we will lose some of the plants before their introduction to science. Set priority for species those are sensitive to disturbance and locate them in the habitat using Geographical Information System (GIS) technique. Much effort should be given to increase their number using different propagation techniques either *in situ* or *ex situ* conditions. Effort should be made to give alternate source of income for forest products dependent people. Forest and biodiversity protection act should be implemented for over ambitious people who destroy in different ways the ability of ecosystems to support biodiversity. In 2010, the status of area has been shifted to the wildlife sanctuary because of the presence of Asian wild threatened elephant. A small part of the sanctuary has also been declared as nature Reserve Park to gain public support for biodiversity conservation. The present list of plant biodiversity (535 species) is still considered as preliminary. There might be some more species yet to be listed and few specimens remain unidentified. Based on the field observations and present preliminary results it may be concluded that the sanctuary is rich in the plant diversity and the sanctuary is the home for so many threatened plant species in context of Bangladesh. Field observation also confirmed that regeneration of tree species in the habitat is severely hampered because of anthropogenic pressure and minor product collections. Invasive species such as *Urena lobata*, *Mikania cordata*, *Chromolaena odorata* etc. are another challenge to future regeneration of forest trees in the disturbed areas. The study suggests for further long term research to focus all aspects of plant biodiversity to help in making proper management plan for this sanctuary.

Acknowledgement

The paper is the outcome of the project entitled “Biodiversity monitoring in selected forests of Bangladesh” funded by Arannayk Foundation Bangladesh and implemented by the Wildlife Research Group, Department of Zoology, Jahangirnagar University. Cooperation of Forest Department during field study is duly acknowledged.
