

AN ANNOTATED CHECKLIST OF THE ANGIOSPERMIC FLORA OF RAJKANDI RESERVE FOREST OF MOULVIBAZAR, BANGLADESH

A.K.M. KAMRUL HAQUE¹, SALEH AHAMMAD KHAN, SARDER NASIR UDDIN²
AND SHAYLA SHARMIN SHETU

Department of Botany, Jahangirnagar University, Savar, Dhaka 1342, Bangladesh

Keywords: Checklist; Angiosperms; Rajkandi Reserve Forest; Moulvibazar.

Abstract

This study was carried out to provide the baseline data on the composition and distribution of the angiosperms and to assess their current status in Rajkandi Reserve Forest of Moulvibazar, Bangladesh. The study reports a total of 549 angiosperm species belonging to 123 families, 98 (79.67%) of which consisting of 418 species under 316 genera belong to Magnoliopsida (dicotyledons), and the remaining 25 (20.33%) comprising 132 species of 96 genera to Liliopsida (monocotyledons). Rubiaceae with 30 species is recognized as the largest family in Magnoliopsida followed by Euphorbiaceae with 24 and Fabaceae with 22 species; whereas, in Liliopsida Poaceae with 32 species is found to be the largest family followed by Cyperaceae and Araceae with 17 and 15 species, respectively. *Ficus* is found to be the largest genus with 12 species followed by *Ipomoea*, *Cyperus* and *Dioscorea* with five species each. Rajkandi Reserve Forest is dominated by the herbs (284 species) followed by trees (130 species), shrubs (125 species), and lianas (10 species). Woodlands are found to be the most common habitat of angiosperms. A total of 387 species growing in this area are found to be economically useful. 25 species listed in Red Data Book of Bangladesh under different threatened categories are found under Lower Risk (LR) category in this study area.

Introduction

Rajkandi Reserve Forest (RRF) is located in Kamalganj upazilla under Moulvibazar district of Bangladesh. This forest area consists of ca. 2,450 hectares' land of Rajkandi forest range that lies between the 24°12'-24°17'N and 91°51'-91°55'E, and comprises diverse habitats and ecosystems. This tropical semi-evergreen forest falls within the Indo-Burma hot-spot of biodiversity (Myers *et al.*, 2000).

The extensive floristic exploration throughout British India conducted by J.D. Hooker (1872-1897) included the Sylhet region of the present political boundary of Bangladesh. Later, David Prain (1903) covered different regions of Bangladesh including Sylhet under his floristic exploration. Kanjilal *et al.* (1934, 1938-1940) included some areas of Sylhet region too. In those studies, any specific or detail information on local distribution and voucher specimens of the taxa described are missing. Later on, various sporadic inventories have been completed in different areas of greater Sylhet region, such as Das (1968), Alam (1988), Arefin *et al.* (2011), Uddin and Hassan (2004) and Sobuj and Rahman (2011). However, the flora and plant diversity of Moulvibazar district, have not yet been explored, except the plant diversity (Uddin and Hassan, 2010) or a plant group (Haque *et al.*, 2016) of a particular area. Taxonomic data on the current floristic composition of RRF collected through field inventories and examination of representative plant specimens are still lacking, though such data are important for the sustainable use and

¹Corresponding author. Email: kamrulhaque1234@gmail.com

²Bangladesh National Herbarium, Zoo Road, Mirpur-1, Dhaka 1216, Bangladesh.

conservation of plant resources and resource-based development of the area. Therefore, an inventory on the floristic composition of RRF was conducted with the objectives to produce an annotated checklist of the angiospermic species of the area; to determine the current status of threatened species of angiosperms from Bangladesh in this forest; and to collect and preserve representative plant specimens for future reference.

Materials and Methods

Taxonomic inventories were conducted during 2010 to 2015 through 25 field trips in different seasons throughout the study area (Fig. 1). Necessary field data and representative plant specimens were collected and preserved following standard herbarium techniques (Bridson and Forman, 1989; Singh and Subramaniam, 2008). All plant specimens were preliminarily identified through consulting the experts and matching with relevant voucher specimens preserved at Jahangirnagar University Herbarium (JUH), and Bangladesh National Herbarium (DACP). Some critical specimens were identified at Central National Herbarium, Howrah, India (CAL) during the visit of one of the authors.

The identification of the plant specimens were verified by matching with the images of pertinent type specimens available in the websites of international herbaria and consulting taxonomic descriptions and keys available in the relevant literatures (Hooker, 1872-1897; Prain, 1903; Wu and Raven, 1994-2001; Wu *et al.*, 1999-2013).

Nomenclature of each taxon was verified following Flora of China (Wu and Raven, 1994-2001; Wu *et al.*, 1999-2013) and the nomenclatural databases of The Plant List (2013) and TROPICOS (2017). The common names have been cited based on Huq (1986), Pasha and Uddin (2013) and interview with the local people. The families have been arranged following Cronquist (1981), and the genera and species under each family have been arranged alphabetically (Table 1). The economic uses of the species were recorded through interviews with the local people during the field surveys, and consulting the relevant literatures (e.g., Ghani, 1998; van Valkenburg and Bunyaphraphatsara, 2002). Status of threatened plant species listed in Red Data Book of Bangladesh (Khan *et al.*, 2001; Ara *et al.*, 2013) was assessed in context to RRF through field observation on natural distribution and regeneration of each species throughout the area, and IUCN threatened category was estimated consulting IUCN (2001). The voucher specimens have been preserved at JUH and DACB.

Results and Discussion

A total of 549 species of angiosperms under 412 genera and 123 families have been recorded from RRF with their natural distribution (Table 1). Among these families, 98 (79.67%) representing 316 genera and 418 species are identified as dicotyledons (Magnoliopsida), whereas, only 25 (20.33%) families consisting of 96 genera and 132 species as monocotyledons (Liliopsida). Among these families, 46 are represented by single species each and only 10 families by more than 10 (10-33) species. This reserve forest is dominated by the herbs comprising 284 species that are followed by trees of 130 species, shrubs of 125 species, and lianas of 10 species. These data indicate that Rajkandi Reserve Forest is floristically rich.

In Magnoliopsida, Rubiaceae with 30 species of 21 genera is recognized as the largest family in RRF followed by Euphorbiaceae with 24 species of 19 genera and Fabaceae with 22 species belonging to 17 genera. Poaceae consisting of 32 species of 25 genera is found to be the largest family in Liliopsida, followed by Cyperaceae with 17 species of nine genera and Araceae with 15 species of 13 genera. *Ficus* with 12 species is found as the largest genus in the area, which is

followed by *Ipomoea*, *Cyperus* and *Dioscorea* with five species each and *Maesa*, *Piper*, *Senna*, *Terminalia*, *Phyllanthus*, *Mussaenda*, *Ixora* and *Bambusa* with four species each.

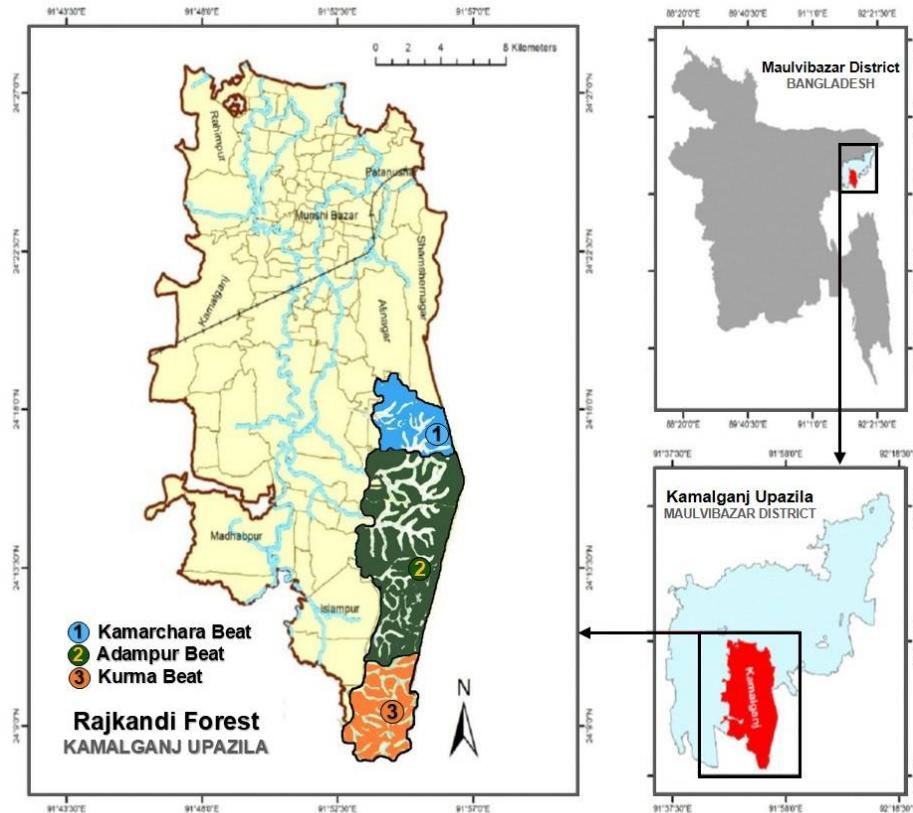

Fig. 1. Rajkandi Forest Range, Kamalganj, Moulvibazar, Bangladesh. (Source: Modified from Haque *et al.*, 2016).

The composition and distribution of species in all of the three forest beats of RRF, namely Adampur, Kurma and Kamarchara, were found to be variable remarkably. A total of 231, 26 and five species were found to occur exclusively in Adampur-, Kamarchara- and Kurma beats, respectively. The occurrence of total 538 species in Adampur beat, with 231 species exclusive and additional 307 species overlapping in other two beats (240 in Kurma and Kamarchara, 46 in Kurma and 21 in Kamarchara), indicates that this forest beat could be considered as a hotspot of biodiversity.

In this forest, woodlands were found to be the most common habitats harbouring the highest number of species (157 species), and this might be due to accumulation of nutrient components and humus-rich soil. In contrast, the finding of hill top to harbour relatively lower number of species (16 species) might be due to their poor humus and nutrient components.

The total number of angiosperm species (549) found in Rajkanndi Reserve Forest during this study is 15.20% of the total 3,611 species, and that of angiosperm families (123) is 59.42% of the total 207 families reported for Bangladesh (Ahmed *et al.*, 2008-2009).

LEGEND: **Habit.** cl = climbing, cr = creeping, de = decumbent, ep = epiphytic, e = erect, er = erect reed, l = large, m = medium, pr = prostrate, ps = parasitic, aq = aquatic, s = small, sc = scandent, vi = vine. **HABITAT.** cu = cultivated, fe = forest margin, fv = forest valley, gl = grassland, ht = hill top, hs = hill slope, ml = marginal land, pl = planted, rb = river bank, rs = roadsides, sj = scrub jungle, wd = in forest. **Distrib.** = Distribution. Ad = Adampur beat, Ka = Kamarchara beat, Ku = Kurma beat. **Use.** Co = cosmetics, Dy = dye, Du = domestic uses, Fb = Fibre, Fd = fodder, Fr = Fruit, Fw = fuel wood, Gm = green manure, I = insecticide, Ju = juice, M = medicine, O = ornamental, Ol = oil, Pe = perfume, Pu = pulse, St = shade tree, Sb = soil binder, Sp = spice, Sw = soft wood, T = timber, and V = vegetable. **RSE** = Representative Specimens Examined. * = Species listed in Red Data Book of Vascular Plants of Bangladesh.

In respect to land area, the number of angiosperm species found in RRF during this study seems higher than that reported by few studies on the protected areas of Bangladesh, e.g., Teknaf Game Reserve (Khan *et al.*, 1994), and Chunuti Wildlife Sanctuary (Khan and Huq, 2001). In contrast, the number of angiosperm species found in RRF is lower than that of some other protected areas of the country, e.g., Rema-Kalenga Wildlife Sanctuary (Uddin and Hassan, 2004), and Lawachara National Park (Uddin and Hassan, 2010). These data indicate that this reserve forest houses an important portion of the flora of Bangladesh.

The study recognizes a total of 387 angiosperm species of RRF as economically useful and among these species 82 are useful in two and 17 in three categories. The major categories of these economically useful species are medicinal (231 species), timber (50 species), fruit (49 species), ornamental (47 species), vegetable (34 species), fodder (23 species), domestic uses (19 species), fuel wood (11 species), and soil binder (9 species).

The RRF area houses 25 species included as threatened in the Red Data Book of Vascular Plants of Bangladesh (Table 1; Khan *et al.*, 2001; Ara *et al.*, 2013). This enumeration of threatened species is higher in respect to that reported for few forest areas, e.g., Lawachara National Park (Uddin and Hassan, 2010) and Sundarban Mangrove Forest (Rahman *et al.*, 2016), and on the other hand, lower in respect to that recorded from other forest areas of Bangladesh (e.g., Rema-Kalenga forest; Uddin and Hassan, 2004). All of these 25 species were found in many localities of RRF with normal natural regeneration and any threat or stress exclusive for these species could not be recognized there, and therefore, they were categorized under the Lower Risk (LR) category for Rajkandi Reserve Forest.

This checklist provides basic information on all angiosperm species currently occurring in the Rajkandi Reserve Forest, which can be considered as an important database as well as baseline to track the trend of changes in the floristic composition of this reserve forest in course of time and different biogeographical processes. This study also informs the current status of 25 threatened species in RRF. These data might be useful in planning, management, conservation and sustainable development of this valuable forest resource of Bangladesh.

Acknowledgements

The authors are grateful to the authorities of the Bangladesh Forest Department, Bangladesh National Herbarium (DACB) and Dhaka University Salar Khan Herbarium (DUSH) for their co-operation during conducting this study. The authors are thankful to the Chief Editor and the Reviewers of the Journal for their critical review of the manuscript.
