

FLORISTIC DIVERSITY (MAGNOLIIDS AND EUDICOTS) OF BARAIYADHALA NATIONAL PARK, CHITTAGONG, BANGLADESH

MOHAMMAD HARUN-UR-RASHID¹, SAIFUL ISLAM AND SADIA BINTE KASHEM

Department of Botany, University of Chittagong, Chittagong 4331, Bangladesh

Keywords: Plant diversity; Baraiyadhala National Park; Conservation management.

Abstract

An intensive floristic investigation provides the first systematic and comprehensive account of the floral diversity of Baraiyadhala National Park of Bangladesh, and recognizes 528 wild taxa belonging to 337 genera and 73 families (Magnoliids and Eudicots) in the park. Habit analysis reveals that trees (179 species) and herbs (174 species) constitute the major categories of the plant community followed by shrubs (95 species), climbers (78 species), and two epiphytes. Status of occurrence has been assessed for proper conservation management and sustainable utilization of the taxa resulting in 165 (31.25%) to be rare, 23 (4.36%) as endangered, 12 (2.27%) as critically endangered and 4 species (0.76%) are found as vulnerable in the forest. Fabaceae is the dominant family represented by 75 taxa, followed by Rubiaceae (47 taxa), Malvaceae (28 species), Asteraceae (27 species) and Euphorbiaceae (24 species). Twenty-three families represent single species each in the area.

Introduction

Baraiyadhala National Park as one of the important Protected Areas (PAs) of Bangladesh that lies between $22^{\circ}40.489' - 22^{\circ}48' \text{N}$ latitude and $90^{\circ}40' - 91^{\circ}55.979' \text{E}$ longitude and located in Sitakundu and Mirsharai Upazilas of Chittagong district. The forest is under the jurisdiction of Baraiyadhala Forest Range of Chittagong North Forest Division. The park encompasses 2,933.61 hectare (7,249 acres) area and is classified under Category II of the International IUCN classification of protected areas (Hossain, 2015). Formerly, it was a part of the Reserved Forest of Chittagong North Forest Division, and was declared as Baraiyadhala National Park on 6th April, 2010 by the Ministry of Environment and Forest through a Gazette notification no. MoEF/For-Sec-02/02 National Park/10/2010/210 dated 06/04/2010 under the Provisions of Article 23(1) of the Bangladesh Wildlife (Preservation) (Amendment) Act, 1974; which has now been altered by Wildlife (Conservation and Security) Act, 2012 (Hossain, 2015). The park comprises three blocks: Baraiyadhala and Wahidpur Blocks under Baraiyadhala Forest Beat, and Kunderhat Block under Bartakia Forest Beat.

The landscape of the forest is characterized by hills, valleys, gullies and numerous water streams and covered mainly by secondary degraded forests and plantations. Floristically Baraiyadhala National Park is rich and diverse. Hence, it is very important to take proper steps to conserve this natural forest; and to explore, document and analyze the species diversity occurring in the Baraiyadhala National Park before disappearing from nature.

However, the forest has not been botanized to determine the plant species diversity, their status of occurrence and conservation measures. Therefore, the present investigation aims to explore, collect, and document the Angiospermic (Magnoliids and Eudicots) plant resources in the forest, their conservation management and sustainable utilization.

Material and Methods

The survey of the flora has been made through repeated field visits during February 2016 to July 2017 in Baraiyadhala National Park. Random sampling and collections of fertile specimens have been made for identification and voucher specimens have been preserved at Herbarium of Chittagong University (HCU). Collected specimens have been critically examined, studied and identified. Identifications have been confirmed by consulting standard literature and specimens and taxonomists of HCU and Bangladesh National Herbarium (DACP).

Nomenclature has been updated following recent literature (Ahmed *et al.*, 2008, 2009a,b,c,d; Rashid and Rahman, 2011, 2012), and confirmed with consulting The Plant List (2013) (<http://www.theplantlist.org>). Families are arranged according to the classification of Angiosperm Phylogeny Group (APG IV, 2016). The taxa are listed alphabetically under each family along with their habit, Bangla name, and status of occurrence (Table 1). Local names of many plants have been noted from local people during field trips and/or consulting Prain (1903), Heinig (1926), Huq (1986), Das and Alam (2001), and Dey *et al.* (1999).

Results and Discussion

The present inventory provides the first systematic and comprehensive account of the floral diversity of the forest and recognizes 528 wild taxa belonging to 337 genera and 73 families (Magnoliids and Eudicots) in the park (Table 1).

Baraiyadhala National Park presents diverse habitat including hills, valleys, gullies and numerous water streams and covered mainly by secondary degraded forests. Some patches of the forest are planted with *Acacia auriculiformis* (Akashmoni), *Artocarpus chama* (Chapalish), *Chukrasia tabularis* (Chikrassi), *Eucalyptus* sp. (Eucalyptus), *Gmelina arborea* (Gamar), *Dipterocarpus turbinatus* (Garjan), *Swietenia mahagoni* (Mehogini), *Azadirachta indica* (Neem), *Aphananixis polystachya* (Pitraj), *Tectona grandis* (Segun), *Hopea odorata* (Telsur), *Toona ciliata* (Toon) etc. The palms, rattans and bamboos mostly occupy the valleys. Common shrubs, herbs, grasses and babanas are fragmented to degraded habitats. A few individuals of Boilam (*Anisoptera scaphula*), Civit (*Swintonia floribunda*) and Lohakat (*Xylia xylocarpa* var. *kerrii*) are still available as characteristic elements of the forest. Some epiphytic species of *Cymbidium*, *Dendrobium*, *Drynaria*, *Rhipidophora*, and *Phothos* are distributed in the forest area, while luxuriant growth of Aroids, Begonias, Bryophytes and Pteridophytes is observed in the natural moist habitats of the park. One of the most characteristic features of this forest is the occurrence of three indigenous gymnospermic species, *Cycas pectinata* Buch.-Ham., *Podocarpus nerifolius* D. Don and *Gnetum montanum* Markgr. In Bangladesh, Baraiyadhala National Park is the only home of *C. pectinata*. The biodiversity of the area is highly imperiled due to anthropogenic activities, including habitat destruction, over-exploitation, unsustainable hunting and all of these three species are critically endangered and are on the verge of extinction in the forest. However, Nguyen (2010) categorizes *C. pectinata* as Vulnerable (VU).

The park is dominated by trees and herbs consisting of 179 (33.90%) and 174 (32.95%) species respectively, followed by 18% shrub (95 spp.), 14.77% climbers (78 spp.), and two epiphytes. Fabaceae appears as the largest family with 75 taxa, followed by Rubiaceae (47 taxa), Malvaceae (28 spp.), Asteraceae (27 spp.) and Euphorbiaceae (24 spp.). Twenty-three families are represented by single species each in the study area. Ten dominant families (Fig. 2) constitute 320 species amounting 60.60% of the total species reported from the park, while remaining 63 families comprise only 39.40% of total species.

Status of occurrence has been assessed for proper conservation management and sustainable utilization of the natural resources of the forest. A total of 165 species (31.25%) are found to be rarely distributed in the forest, while 23 (4.36%) are assessed as endangered, 12 (2.27%) as

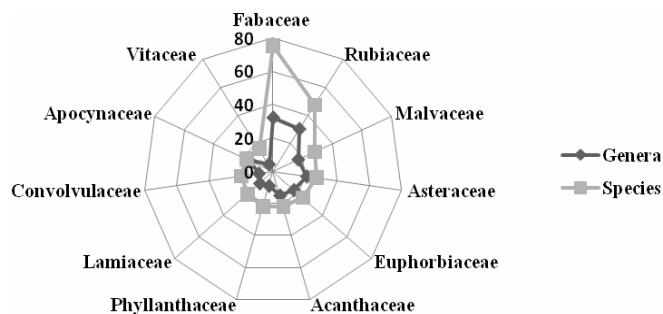

Fig. 2. Radar diagram shows ten dominat plant families in the Baraiyadhala National Park.

critically endangered and 4 species (0.76%) as vulnerable. All species belonging to the families Anacardiaceae (10 spp.), Bignoniaceae (3 spp.), Dipterocarpaceae (4 spp.), and Meliaceae (8 spp.) are trees and under threat in the forest. Rahman (2013) reported *Artobotrys caudatus* of the family Annonaceae as possibly extinct in Bangladesh. Recently this species has been reported from Hazarikhil Wildlife Sanctuary by Rahman (2017) and current investigation also reports its distribution in the Baraiyadhala National Park.

The present study reveals that communities around the area depend more or less on forest resources and some organized encroachers are also noticed. Furthermore, forest fire, livestock and other unsustainable resource utilization practices degrade the habitat in and around the forest. Climate change is an additional threat which may directly affect habitat and biodiversity, as well as indirectly by further increasing human pressure due to migration of peoples from coastal parts of Sitakunda and Mirsharai to the forest area. Development of tourism may enhance a future threat to the park. To address these challenges sustainable management plan for the protected area should be undertaken in the light of National Conservation Strategy, and proper implementation of the action plan is urgently required with collaboration and cooperation of stakeholders and local administrations. More particularly, the rare and threatened species along with their degraded habitats to be protected by taking proper conservation management programmes.

Acknowledgements

This study was supported by Research Allocation Fund under Revenue Budget, University of Chittagong, Bangladesh. We are thankful to Prof. Dr. M. Atiqur Rahman, Department of Botany, University of Chittagong for his generous help and cooperation during the course of this study.
