Keywords: Flora; Angiosperms; Satkhira; Bangladesh.

Abstract

This study presents elementary taxonomic data on the composition of vascular flora in the disaster prone coastal district Satkhira of Bangladesh. The results of this study show that this district houses 664 species under 468 genera and 133 families of vascular plants. The Pteridophytes and Gymnosperms are represented by 21 and five species, whereas, the Magnoliopsida (dicotyledons) and Liliopsida (monocotyledons) of Angiosperms by 494 and 144 species, respectively. About 59.64% of these species are herbs, 15.96% shrubs, 21.69% trees, 2.26% palms and 0.45% bamboos. Total 73.04% of the species are wild, 19.88% planted and 7.08% cultivated. In this area, Fabaceae with 31 species is the largest family, followed by Asteraceae with 27 species, Apocynaceae with 26 species and Malvaceae with 25 and Acanthaceae with 22 species. *Ficus* with seven species is recorded as the largest genus, which is followed by *Solanum*, *Hygrophila*, *Euphorbia*, *Senna*, *Phyllanthus*, *Ipomoea*, *Hibiscus* and *Alternanthera*. Most of the species are found in fallow lands, roadsides, woodlands, homesteads and scrub jungles and useful as medicine, ornamental, fibre, fruit, livestock feed, soil binder and timber. The floristic composition of this district is still rich, though most of its habitats and ecosystems are vulnerable to natural disasters. Effective conservation plan and measures should be adopted for the precious flora of this coastal district.

Introduction

Knowledge on floristic composition and structure is essential in identifying the important elements and understanding the status, extent, assessment of plant biodiversity (WCMC, 1992). It is also useful in exploration of alternative species, identification and conservation of threatened species and helpful in sustainable utilization of plant biodiversity. Thus, studies on floristic composition and structure of different areas and countries throughout the world become imperative due to which large-scale floristic inventories have been conducted in various forest- and non-forest areas globally for over a century (Ostertag *et al.*, 2014).

As a significant part of the South Asian Mega Centre of genetic diversity (Chowdhury, 1996), Bangladesh houses a rich biodiversity including a huge number of plant species (Approx. 5000 species of Angiosperms, Khan, 1977), though it is one of the countries, most vulnerable to climate change, and ranked as one of the world's most disaster-prone area (Choudhury, 2002; World Bank, 2005). However, the floristic composition of this country has so far been partially explored through various kinds of inventories conducted in 18th to 20th centuries. The large-scale floristic studies covering the area of the present political boundary of Bangladesh does do not provide habitat-, area- or district-specific detail data on floristic composition (Hooker, 1872-1897; Prain,

¹ Corresponding author. Email: gazibotju@gmail.com

² Bangladesh National Herbarium, Chirakhana Road, Mirpur 1, Dhaka 1216, Bangladesh

1903; Siddiqui *et al.*, 2007; Ahmed *et al.*, 2008-2009; Ahmed *et al.*, 2009). Most of the small to medium scale floristic studies conducted in this country so far cover mostly the north-eastern and south-eastern highland regions and forested areas of this country (Uddin *et al.*, 1998; Khan and Huq, 2001; Rashid and Mia, 2001; Uddin *et al.*, 2003; Islam *et al.*, 2009; Arefin *et al.*, 2011; Rahman, 2017; Haque *et al.*, 2018; Uddin and Hassan, 2018). Some studies in plain land and coastal regions of the country have also been conducted (Sultana, 2012; Rahman *et al.*, 2015; Tabassum, 2015; Shetu *et al.*, 2018; Rahman *et al.*, 2019; Khanam *et al.*, 2020; Roy and Khan, 2020). In spite of these studies, the floristic composition in most of the areas of this country is unknown till now. Therefore, conducting adequate studies on the floristic composition in these areas are crucial to know the composition, structure and status of their plant resources.

Satkhira is one of the costal districts of Bangladesh that are most vulnerable to the natural disasters, which affect the coastal region frequently, and sometimes severely. This district is one of the most risk prone areas of Bangladesh, because most of its habitats and ecosystems are being degraded due to the consequences of different natural disasters and human interventions, and most of its natural vegetation are being replaced by settlements, agricultural expansions, shrimp cultures and other human activities. Protecting and maintaining the biodiversity in the coastal areas is one of the biggest conservation challenges today. However, the first key step to achieve this goal is to complete the floristic explorations and compile the updated lists of species extant in these areas (Schaminée *et al.*, 2011; Sharrock, 2012). But so far, no floristic study is known to be carried out throughout Satkhira district based on field inventories and examination of plant specimens. The floristic study of Rahman *et al.* (2015) covers the Sundarban Mangrove area of this district belonging to its Shamnagar upazila but it does not provide specific information on plant species composition and distribution in this administrative area.

Floristic studies throughout this district are required to generate the baseline taxonomic data on the current composition and status of plant species, help in adopting appropriate conservation initiatives for the threatened or near threatened species, promote the plant resource-based socio-economic development projects and contribute in future studies on the change in floristic composition, plant species diversity and vegetation in this area. Therefore, there is a great scope and need for conducting a detail floristic study throughout this district. This study has been carried out to construct a taxonomic checklist and provide quantitative data on the vascular plants of Satkhira district based on thorough taxonomic inventories throughout the area.

Materials and Methods

Satkhira district, located in between 21°36'-22°54' N and 88°54'-89°20' E, comprises an area of 3,817.29km², including 1632.00km² forests, and consists of seven upazilas and 79 unions (Population and Housing Census, 2015). It is bounded by Jessore district on the north, the Bay of Bengal on the south, Khulna district on the east, West Bengal state of India on the west. The topography of this district is flat, with a maximum elevation range of 17.06 metre and an average elevation above sea level of 6.40 metre. This area is covered by cropland, grassland, wet lands, scrub jungles, mangrove forests and homestead gardens etc. Over the course of the year, the temperature typically varies from 13.89°C to 35°C and is rarely below 11°C or above 37.78°C. Since the last decade, the trend of change in maximum, minimum and mean temperature in rainy and summer seasons in Satkhira district is increasing, whereas that in minimum and mean temperature in winter season and total rainfall in rainy and summer seasons are decreasing (<http://datalibrary.bmd.gov.bd>). In the muggiest months, the highest humidity ranges from 73% to 92% (www.worldweatheronline.com).

This study was based on a thorough taxonomic inventory conducted in different seasons of 2017-2020 throughout the Satkhira district. The collection, processing, drying and preservation of plant specimens were done following standard herbarium methods and techniques (Bridson and Forman, 1989; Singh and Subramaniam, 2008). The representative plant specimens of all taxa were examined at Plant Systematics and Biodiversity Laboratory of Jahangirnagar University and Bangladesh National Herbarium (DACP). Identification of the specimens was completed through consulting the taxonomic descriptions and keys available in the relevant literatures (Hooker, 1872-1897; Prain, 1903; Wu and Raven, 1994-2001; Wu *et al.*, 1999-2013; Siddiqui *et al.*, 2007; Ahmed *et al.*, 2008-2009; Ahmed *et al.*, 2009), and by matching with the respective voucher specimens of DACB and Jahangirnagar University Herbarium (JUH). The relevant type images available in the web pages of different international herbaria, such the Royal Botanic Gardens Kew (K), and the Conservatoire et Jardin botaniques de la Ville de Genève (G) etc., and illustration of Flora of China (Wu and Raven, 1994-2001; Wu *et al.*, 1999-2013) were also matched. All voucher specimens have been preserved at JUH.

Nomenclatural information were verified following Flora of China (Wu and Raven, 1994-2001; Wu *et al.*, 1999-2013), The Plant List (2013) and TROPICOS (2017). The bangla names were collected from Huq (2019), Siddiqui *et al.* (2007), Ahmed *et al.* (2008-2009) and Ahmed *et al.* (2009), and through interviews with the local people. The families of Pteridophytes and Gymnosperms have been arranged following Pichi (1977) and Kramer and Green (1990), respectively, and those of Angiosperms following Cronquist (1981), whereas the genera and species under each family alphabetically (Table 1).

Data on uses of the species were collected through interviews with the local people during the field surveys, and consulting the relevant literatures (Ghani, 1998; Van Valkenburg and Bunyaphraphatsara, 2002; Siddiqui *et al.*, 2007; Ahmed *et al.*, 2008-2009; Ahmed *et al.*, 2009). The status of rare and threatened plant species in the study area was inferred through field observation and estimation on population size, distribution range and regeneration of each species in the area.

Results and Discussion

During this study the vascular flora of Satkhira district was found to be composed of 664 species under 468 genera and 133 families. Pteridophytes were represented by 21 species of 18 genera under 12 families and Gymnosperms by five species of four genera under four families, and Magnoliopsida (dicotyledons) and Liliopsida (monocotyledons) of Angiosperms by 494 and 144 species of 348 and 98 genera under 92 and 25 families, respectively (Table 1 and Fig. 1). Total 396 (59.64%) of these species were herbs, 144 (21.69%) trees, 106 (15.96%) shrubs, 15 (2.26%) palms and three (0.45%) bamboos. Most of the herbs were erect (48.99%), climber (19.19

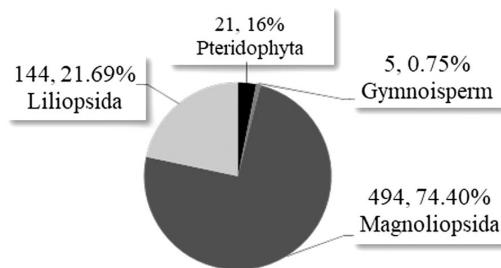

Fig. 1. Species composition (number and percent of species) of different plant groups of Satkhira district.

(%) and prostrate (16.92%) that were followed by creeper, parasite, free floating, submerged and epiphyte (Fig. 2). All species of Pteridophytes were found as wild but those of the Gymnosperms as planted, whereas among the Angiosperms total 464 (72.73%) species were wild, 127 (19.91%) planted and 47 (7.37%) cultivated. 349 (75.22%) species of the dicots and 115 (24.78%) species of the monocots were wild and the rest were cultivated or planted.

In Magnoliopsida, Fabaceae with 31 species under 19 genera, representing 4.72% of the vascular flora of Satkhira district, was the largest family, followed by Asteraceae with 27 species of 26 genera, Apocynaceae with 26 species of 23 genera, Malvaceae with 25 species of 17 genera, Acanthaceae with 22 species of 13 genera, Rubiaceae with 18 species under 12 genera, Cucurbitaceae and Lamiaceae, each with 17 species under 12 and 14 genera, respectively, Solanaceae with 15 species of eight genera, Caesalpiniaceae with 13 species of eight genera, Moraceae with 12 species under four genera, and Amaranthaceae and Mimosaceae, each with 12 species under eight genera. *Ficus* with seven species was recorded as the largest genus, which was followed by *Euphorbia*, *Hygrophila*, *Solanum*, each with six species, *Hibiscus*, *Ipomoea*, *Phyllanthus* and *Senna*, each with five species, and *Alternanthera*, *Amaranthus*, *Dalbergia*, *Desmodium*, *Ludwigia*, *Oldenlandia*, *Persicaria*, *Sida*, *Terminalia* and *Vigna*, each with four species.

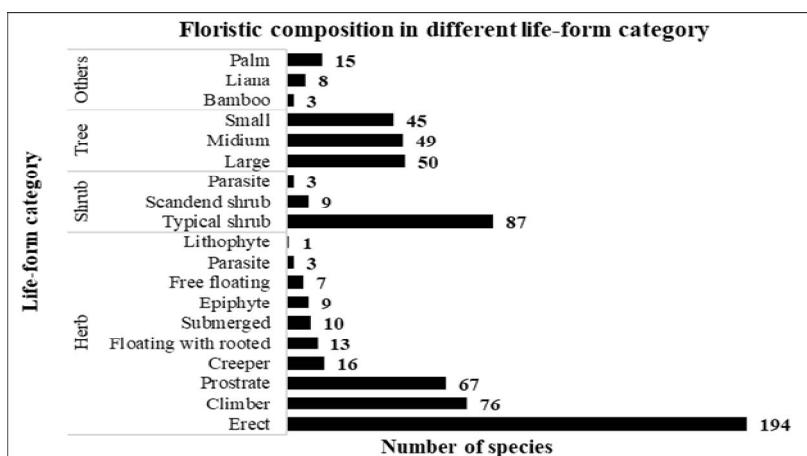

Fig. 2. Floristic composition in different life-form categories of Satkhira district.

In Liliopsida, Poaceae with 44 species under 30 genera, comprising 6.70% of the vascular flora of this area, was the largest family, and followed by Cyperaceae with 22 species under eight genera, Arecaceae and Araceae, each with 15 species under 12 and 13 genera, respectively. *Cyperus* with 10 species was the largest genus, which was followed by *Commelina* and *Paspalum*, each with four species and *Bambusa* and *Calamus*, each with three species.

In Satkhira district, total 403 (60.69%) plant species were found to be distributed in Satkhira sadar, 355 (53.46%) in Shaymnagar, 334 (50.30%) in Kaligonj, 318 (47.89%) in Debhata, 315 (47.44%) in Kolarowa, 296 (44.58%) in Tala and 235 (35.39%) in Ashasuni upazila, but most of the species found in each of these upazilas were overlapping with that of other upazila/s. A total of 152 (22.89%) species were found to be distributed in a part of the Sundarbans mangrove forest, situated in the southern part of Shaymnagar upazila of Satkhira district, of which 65 (9.79%) species were exclusively distributed in that mangrove habitat and the rest 87 (13.10%) species were found to overlapping with other upazilas of this study area.

Total 147 plant species including 113 species of dicotyledons, 31 species of monocotyledons and three species of Pteridophytes were found in all upazilas, but no species of Gymnosperms was commonly found in all upazilas. Only 71, 44, 14, 12, six and four species were exclusively found in Shyamnagar, Satkhira Sadar, Kaligonj, Debhata, Kolaroa and Tala upazila, respectively and no species was exclusively distributed in Assashuni upazila. In this district, the plant species were found in diverse habitats, however, most of the species were well-adapted in fallow lands and roadsides, which were followed by, woodlands, homesteads, agricultural fields, scrub jungles, grass lands, wetlands, marginal lands (including forest margins and river banks). Some species were also found on few tree species and on brick walls (Fig. 3).

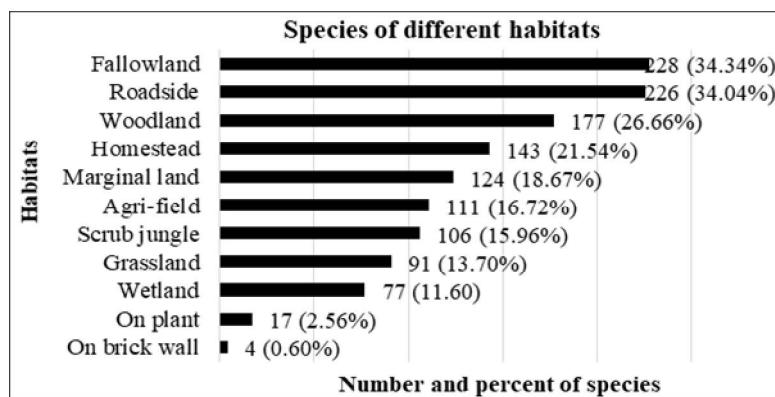

Fig. 3. Distribution of plant species in different habitats of Satkhira district.

All species recorded from Satkhira district are economically or ecologically useful and most of these species have more than one uses. Most of the species (476; 71.69%) are useful as medicine, which are followed by 112 (16.87%) species of ornamentals, 73 (10.99%) of vegetables, 50 (7.53%) of fruits and livestock feed each, 38 (5.72%) of timbers, 33 (4.97%) of fibres and 26 (3.92%) of fuel woods. Additionally, 19 (2.86%) species have been distinguished as useful in producing green manure, 17 (2.56%) in dye yielding, 14 (2.11%) in handicrafts making, 12 (1.81%) as hedge, 12 (1.81%) as thatching material, 11 (1.66%) as spices and 10 (1.51%) as oil yielding. Few species have been recognized as useful as pulse, water purifying, perfume, cosmetics, edible, fish feed, paper pulp, fish poison, gum, honey plant and juice plant.

In the study area, 17 species, *viz.* *Acanthus volubilis* (Acanthaceae), *Andrographis paniculata* (Acanthaceae), *Baliospermum solanifolium* (Euphorbiaceae), *Barringtonia acutangula* (Lecythidaceae), *Casearia tomentosa* (Salicaceae), *Cerbera odollam* (Apocynaceae), *Diospyros malabarica* (Ebenaceae), *Dodonaea viscosa* (Sapindaceae), Dolichandrone spathacea (Bignoniaceae), *Geodorum densiflorum* (Orchidaceae), *Kaempferia angustifolia* (Zingiberaceae), *Luisia brachystachys* (Orchidaceae), *Parkinsonia aculeata* (Caesalpiniaceae), *Pavetta indica* (Rubiaceae), *Rauvolfia serpentina* (Apocynaceae), *Scadoxus multiflorus* (Amaryllidaceae) and *Zeuxine strateumatica* (Orchidaceae) were found as rare with small population, poor regeneration and restricted distribution. Among these species, *A. paniculata* and *R. serpentina* are listed as threatened species for Bangladesh (Khan *et al.*, 2001).

The taxonomic enumeration of Angiosperm species reported by this study from Satkhira district covering 3,817.29 km² area, is nearly similar to that of Narsingdi district composed of 3360.59 km² area (Khanam *et al.*, 2020; Khanam and Khan, 2020), lower than those reported from Patuakhali district of 3221.31 km² area (Sultana, 2012) and Gazipur district of 1806.36 km² area

(Tabassum, 2015) and higher than that recorded from Rajshahi district situated on 2407.01 km² area (Rahman, 2013).

On the other hand, the taxonomic account of Angiosperm species found in six of the seven upazilas of Satkhira district, viz. Satkhira Sadar, Kaligonj, Shaymnagar, Debhata, Kolarowa and Tala, are higher than those previously reported from different upazilas of some districts of the country, viz. Ramgarh upazila of Khagrachhari district (Islam *et al.*, 2009), Dhamrai upazila of Dhaka district (Rahman *et al.*, 2012), Sadar upazila of Munshiganj district (Rahman *et al.*, 2013), Manikgonj Sadar upazila of Manikgonj district (Sarker *et al.*, 2013), Sadar upazila of Naogaon district (Nahar and Rahman, 2016), Mahadebpur upazila of Naogaon district (Rahman and Kona, 2016), Sreenagar upazila of Munshiganj district (Mahmudah *et al.*, 2017), Ishwardi of Pabna district (Roy and Rahman, 2018), and Gafargaon upazila of Mymensingh district (Rahman *et al.*, 2019) (Fig. 4). In contrast, this enumeration of Angiosperm species is lower than those reported from Belabo and Shibpur upazilas and nearly similar to those reported from Monohordi and Sadar upazila of Narsingdi district (Khanam *et al.*, 2020; Khanam and Khan, 2020) (Fig. 4).

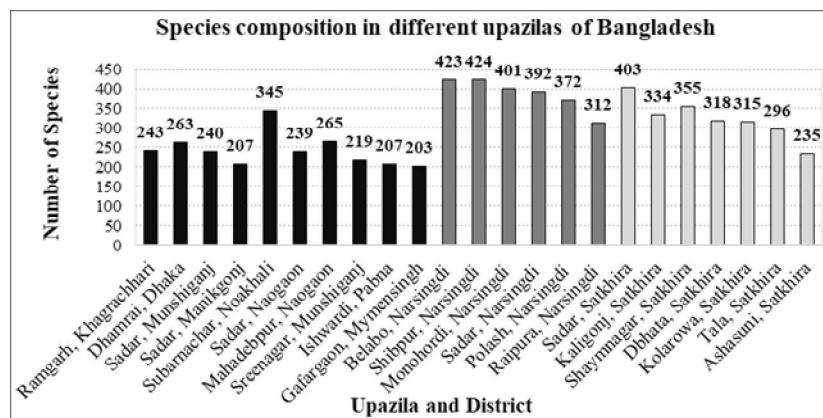

Fig. 4. Angiosperms species composition in different upazilas of Satkhira district in comparison to previous records from different upazilas of some districts of Bangladesh.

Satkhira district is a vulnerable coastal area of Bangladesh due to both natural disasters and anthropogenic causes (Rahman and Ferdous, 2017). Frequent natural disasters, increasing salinity intrusion in both soil and water, invasion of some exotic species (*Acacia auriculiformis*, *Eucalyptus camaldulensis*, *Prosopis juliflora*), poor regeneration, waterlogging and lack of proper management programs etc. are the critical natural problems and threats for its habitat- and ecosystem degradation, the consequences of which are generating colossal negative effects on the local flora and vegetation in this district (Kabir and Eva, 2014). Satkhira is one of the three districts of Bangladesh that accommodate around 80% of total shrimp production (Chowdhury and Muniruzzaman, 2003; Karim, 2003). But the widespread and increasing shrimp farming in this district is now a major anthropogenic threat that is likely to bring severe damages to the local environment and ecosystems, and ultimately to the local flora and vegetation (Kabir and Eva, 2014). However, the flora of the study area is still rich and withstanding through facing frequent natural disasters and severe human interferences, though some of its areas are almost bare.

The taxonomic information provided by this study on the vascular plants of Satkhira districts, might serve as an important guiding database to track the trend of changes in the floristic composition, plant species diversity and vegetation in course of time, especially due to natural and

anthropogenic threats, contribute in undertaking appropriate biodiversity conservation initiatives and plant resource-based socio-economic development, and help in estimating the impacts of climate change in this area. This study highly recommends for regular inventories, monitoring and problem-specific research programs on the flora and plant diversity of this district, conducting intensive research for finding the effective wind and saline tolerant plant species, accomplishment of adequate plantation with appropriate species in the marginal lands of coastal- and river bank areas and implementation of adequate measures for conservation of the threatened and depleting plant species of this district.

Acknowledgements

The authors express their sincere thanks to Grant for Advanced Research in Education (GARE), BANBEIS, for funding this study. The authors are grateful to all people who were directly or indirectly involved in this study. The authors are thankful to the Chief Editor and the Reviewers of the Journal for their critical review of the manuscript.
