Abstract

Following Deissler's theory, the decay for the concentration fluctuation of a dilute contaminant undergoing a first order chemical reaction in MHD turbulence at times before the final period in presence of dust particle is studied and have considered correlations between fluctuating quantities at two and three point. Two and three point correlation equations are obtained and the set of equations is made to determine by neglecting the quadruple correlations in comparison to the second and third order correlations. The correlation equations are converted to spectral form by taking their Fourier transforms. Finally we obtained the Decay law of magnetic energy for the concentration fluctuations before the final period in presence of dust particle by integrating the energy spectrum over all wave numbers.

Keywords: MHD Turbulence, First order reactant, Dust particle, Decay before the final period.

Introduction

A dust particle in air, or in any other gas, has a much larger inertia than the equivalent volume of air and will not therefore participate readily in turbulent fluctuations. The relative motion of dust participate and the air will dissipate energy because of the drag between dust and air, and extract energy from turbulent intensity is reduced than the Reynolds stresses will be decreased and the force required to maintain a given flow rate will likewise be reduced. (Sarker, 1993) discussed the vorticity covariance of dusty fluid turbulence in a rotating frame.

(Deissler, 1958) developed a theory "decay of homogeneous turbulence for times before the final period". Using Deissler's theory, (Loefler and Deissler, 1961) studied the decay of temperature fluctuations in homogeneous turbulence before the final period. In their approach they considered the two and three-point correlation equations and solved these equations after neglecting fourth and higher order correlation terms. Using Deissler theory, (Kumar and Patel, 1974) studied the first-order reactant in homogeneous turbulence before the final period of decay for the case of multi-point and single-time correlation. (Kumar and Patel, 1975) extended their problem, (Kumar and Patel, 1974) for the case of multi-point and multi-time concentration correlation. (Patel, 1976) also studied in detail the same problem to carry out the numerical results. (Sarker and Kishore, 1991) studied the decay of MHD turbulence at time before the final period using (Chandrasakker's relation, 1951). (Sarker and Islam, 2001) studied the decay of MHD turbulence before the final period for the case of multi-point and multi-time. (Azad and Sarker, 2003) studied the Decay of MHD turbulence before the final period for the case of multi-point and multi-time in presence of dust particle. (Islam and Sarker, 2001) studied the first order reactant in MHD turbulence before the final period of decay for the case of multi-point and multi-time. (Sarker and Islam, 2001) also studied the first order reactant in MHD turbulence before the final period of decay.

In our present work, we studied the magnetic field fluctuation of concentration of a dilute contaminant undergoing a first order chemical reaction in dusty fluid MHD turbulence before the final period of decay. Here, we have considered the two-point and three-point correlation equations and solved these equations after neglecting the fourth-order correlation terms. Finally we obtained the decay law for magnetic field energy fluctuation of concentration of dilute contaminant undergoing a first order chemical reaction in dusty fluid MHD turbulence comes out to be

\[
\langle h^2 \rangle = \exp[-R(t-t_0)]\left[A(t-t_0)^{-\gamma} + \exp[fs]B(t-t_0)^{-5}\right]
\]

where \( \langle h^2 \rangle \) denotes the total energy (mean square of the magnetic field fluctuations of concentration), \( t \) is the time and \( A, B \) and \( t_0 \) are constants. \( s \) is an another arbitrary constant which is defined by the equation (36).

**Basic equations**

The equation of motion and continuity for viscous, incompressible MHD dusty fluid turbulent flow are given by (Chandrasekhar, 1951) as

$$
\frac{\partial u_i}{\partial t} + \frac{\partial}{\partial x_k}(u_i u_k - h_k h_i) = -\frac{\partial w}{\partial x_i} + \nu \frac{\partial^2 u_i}{\partial x_k \partial x_k} + (u_i - v_i) f
$$

(1)

$$
\frac{\partial h_i}{\partial t} + \frac{\partial}{\partial x_k}(h_i u_k - u_i h_k) = \lambda \frac{\partial^2 h_i}{\partial x_k \partial x_k}
$$

(2)

$$
\frac{\partial v_i}{\partial t} + v_k \frac{\partial v_i}{\partial x_k} = - \frac{k}{m_s} (v_i - u_i)
$$

(3)

with

$$
\frac{\partial u_i}{\partial x_i} = \frac{\partial v_i}{\partial x_i} = \frac{\partial h_i}{\partial x_i} = 0
$$

(4)

The subscripts can take on the values 1, 2 or 3.

Here, $u_i$, turbulent velocity component; $h_i$, magnetic field fluctuation component, $v_i$, dust velocity component

$$W(\hat{x}, t) = \rho \frac{1}{2} \langle h^2 \rangle,$$

total MHD pressure inclusive of potential force; $p(\hat{x}, t)$ = hydrodynamic pressure, $\rho$ = fluid density, $\rho_M = \frac{\rho}{\lambda}$, magnetic Prandtl number, $P_r = \frac{\nu}{\gamma}$, Prandtl number, $\nu = \frac{K}{\rho c_p}$, kinematic viscosity, $\gamma = \frac{c_p}{\rho}$, thermal diffusivity, $\lambda = \frac{4 \pi \mu \sigma}{3}$, magnetic diffusivity, $c_p$ = heat capacity at constant pressure, $\varepsilon_{m_k} = $ alternating tensor, $f = \frac{k N \rho}{\rho}$, dimension of frequency; N, $m_s = \frac{4}{3} \pi R_s^3 \rho_s$, mass of single spherical dust particle, $\rho_s$, constant density of the material in dust particle, $x_k$, Space co-ordinate, the subscripts can take on the values 1, 2 or 3.

**Two-point correlation and spectral equations**

Under the conditions that (i) the turbulence and the concentration magnetic field are homogeneous (ii) the chemical reaction has no effect on the velocity field and (iii) the reaction rate and the magnetic diffusivity are constant, the induction equation of a magnetic field fluctuation of concentration of a dilute contaminant undergoing a first order chemical reaction at the points $p$ and $p'$ separated by the vector $\hat{r}$ could be written as

$$
\frac{\partial h_i}{\partial t} + u_k \frac{\partial h_i}{\partial x_k} - h_k \frac{\partial u_i}{\partial x_k} = \lambda \frac{\partial^2 h_i}{\partial x_k \partial x_k} - R h_i
$$

(5)

and

$$
\frac{\partial h_i}{\partial t} + u_k \frac{\partial h_i}{\partial x_k} - h_k \frac{\partial u_i}{\partial x_k} = \lambda \frac{\partial^2 h_i}{\partial x_k \partial x_k} - R h_i
$$

(6)

Where $R$ is the constant reaction rate.

Multiplying equation (5) by $h_j$ and (6) by $h_i$, adding and taking ensemble average, we get

$$
\frac{\partial \langle h_i h_j \rangle}{\partial t} + \frac{\partial}{\partial x_k} \left[ \langle u_i, h_j \rangle - \langle h_i, u_j \rangle \right] + \frac{\partial}{\partial x_k} \left[ \langle u_i, h_j \rangle - \langle h_i, u_j \rangle \right] = \lambda \frac{\partial^2 \langle h_i h_j \rangle}{\partial x_k \partial x_k} - 2 R \langle h_i h_j \rangle
$$

(7)

Angular bracket $\langle \ldots \ldots \ldots \rangle$ is used to denote an ensemble average

Using the transformations,

$$
\frac{\partial}{\partial r_k} = \frac{\partial}{\partial x_k} = \frac{\partial}{\partial x_k}
$$

(8)

and the Chandrasekhar relations [8]

$$
\langle u_k, h_j \rangle = \langle u_k, h_j \rangle, \langle u_j, h_k \rangle = -\langle u_j, h_k \rangle
$$

(9)

Equation (7) becomes

$$
\frac{\partial \langle h_i h_j \rangle}{\partial t} + 2 \frac{\partial}{\partial r_k} \left[ \langle u_i', h_j \rangle - \langle h_i, u_j \rangle \right] = 2 \lambda \frac{\partial^2 \langle h_i h_j \rangle}{\partial r_k \partial r_k} - 2 R \langle h_i h_j \rangle
$$

(10)

Now we write equation (10) in spectral form in order to reduce it to an ordinary differential equation by use of the following three-dimensional Fourier transforms.

$$
\langle h_i h_j (\hat{r}) \rangle = \int_{-\infty}^{\infty} \langle \psi_i \psi_j (\hat{k}) \rangle \exp \left[ i (\hat{k}, \hat{r}) \right] \hat{k}
$$

(11)
〈u_i h_j' (\hat{r}) = \int (\alpha_i \psi_i \psi_j' (\hat{k})) \exp [\hat{k} \cdot \hat{r}] d\hat{k} \tag{12}
\)

Interchanging i and j, points p and q then,

\[ \langle u_i' h_j' (\hat{r}) \rangle = \langle u_i h_j' (\hat{r}) \rangle = \int (\alpha_i \psi_i \psi_j' (\hat{k})) \exp [\hat{k} \cdot \hat{r}] d\hat{k} \tag{13} \]

Substituting equation (11) into equation (13) leads to the spectral equation

\[ \frac{\partial \langle \psi_i \psi_j' (\hat{k}) \rangle}{\partial t} + 2K^2 \langle \psi_i \psi_j' (\hat{k}) \rangle + 2R \langle \psi_i \psi_j' (\hat{k}) \rangle = 2ik \langle \langle \alpha_i \psi_i \psi_j' (\hat{k}) \rangle - \langle \alpha_i \psi_i \psi_j' (\hat{k}) \rangle \rangle \tag{14} \]

\[ \Rightarrow \frac{\partial \langle \psi_i \psi_j' (\hat{k}) \rangle}{\partial t} + 2K^2 + R \langle \psi_i \psi_j' (\hat{k}) \rangle = 2ik \langle \langle \alpha_i \psi_i \psi_j' (\hat{k}) \rangle - \langle \alpha_i \psi_i \psi_j' (\hat{k}) \rangle \rangle \tag{15} \]

The tensor equation (15) becomes a scalar equation by contraction of the indices i and j

\[ \frac{\partial \langle \psi_i \psi_j' (\hat{k}) \rangle}{\partial t} + 2K^2 + R \langle \psi_i \psi_j' (\hat{k}) \rangle = 2ik \langle \langle \alpha_i \psi_i \psi_j' (\hat{k}) \rangle - \langle \alpha_i \psi_i \psi_j' (\hat{k}) \rangle \rangle \tag{16} \]

The term on the right hand side of equation (16) is called energy transfer term while the second term on the left hand side is the dissipation term.

**Three-point correlation and spectral equations:**

Similar Procedure can be used to find the three points correlation equation. For this purpose we take the momentum equation of dusty fluid MHD turbulence at the point P and the induction equations of magnetic field fluctuation, governing the concentration of a dilute contaminant undergoing a first order chemical reaction at P, and P separated by the vectors \( \hat{r} \) and \( \hat{r}' \) as

\[ \frac{\partial u_i}{\partial t} + u_k \frac{\partial u_i}{\partial x_k} - h_k \frac{\partial h}{\partial x_k} = - \frac{\partial w}{\partial x_i} + \nu \frac{\partial^2 u_i}{\partial x_i \partial x_k} + f(u_i - v_i) \tag{17} \]

\[ \frac{\partial h_i'}{\partial t} + u_k' \frac{\partial h_i'}{\partial x_k} - h_k' \frac{\partial u_i'}{\partial x_k} = \lambda \frac{\partial^2 h_i'}{\partial x_i \partial x_k} - Rh_i' \tag{18} \]

\[ \frac{\partial h_j''}{\partial t} + u_k'' \frac{\partial h_j''}{\partial x_k} - h_k'' \frac{\partial u_j''}{\partial x_k} = \lambda \frac{\partial^2 h_j''}{\partial x_i \partial x_k} - Rh_j'' \tag{19} \]

where \( W(\hat{x}, t) = \frac{P}{\rho} + \frac{1}{2} \langle h'' \rangle \), total MHD pressure inclusive of potential force \( P(\hat{x}, t) \), hydrodynamic pressure; \( \in_{nl} \), alternating tensor, \( f = \frac{kN}{P} \) dimension frequency; N, constant number density of dust particle.

Multiplying equation (17) by \( h_i h_j' \) (18) by \( u_i h_j'' \) and (19) by \( u_i h_j'' \), adding and taking ensemble average, we obtain

\[ \frac{\partial \langle u_i h_j' h_j'' \rangle}{\partial t} + \frac{\partial \langle u_i u_i h_j'' \rangle}{\partial x_k} - \partial \langle h_i h_j h_j'' \rangle + \frac{\partial}{\partial x^k} \left[ \langle u_i u_i h_j'' \rangle - \langle u_i u_i h_j'' \rangle \right] \]

\[ = - \frac{\partial \langle w h_i h_j'' \rangle}{\partial x_i} + \nu \frac{\partial^2 \langle u_i h_j'' \rangle}{\partial x_k \partial x^k} + \lambda \]

\[ \left[ \frac{\partial^2 \langle u_i h_i'' \rangle}{\partial x_i \partial x_k} + \frac{\partial^2 \langle u_i h_i'' \rangle}{\partial x_k \partial x^k} \right] \]

\[ - 2R \langle u_i h_i h_j'' \rangle + \langle u_i u_i h_j'' \rangle - \langle v_i h_i h_j'' \rangle \tag{20} \]

Using the transformations

\[ \frac{\partial}{\partial x_k} = - \left( \frac{\partial}{\partial r^k} + \frac{\partial}{\partial r^k} \right), \frac{\partial}{\partial x^k} = \frac{\partial}{\partial r^k}, \frac{\partial}{\partial x_k} = \frac{\partial}{\partial r^k} \tag{21} \]

into equation (20)

\[ \frac{\partial \langle u_i h_i h_j'' \rangle}{\partial t} - \lambda \left[ (1 + P_M) \frac{\partial^2 \langle u_i h_i h_j'' \rangle}{\partial r_i \partial r_k} + (1 + P_M) \frac{\partial^2 \langle u_i h_i h_j'' \rangle}{\partial r_i \partial r_k} + 2P_M \frac{\partial^2 \langle u_i h_i h_j'' \rangle}{\partial r_i \partial r_k} + \frac{\partial^2 \langle u_i h_i h_j'' \rangle}{\partial r_i \partial r_k} \right] \]

\[ = \frac{\partial}{\partial r_k} \langle u_i u_i h_i h_j'' \rangle + \frac{\partial}{\partial r_k} \langle u_i u_i h_i h_j'' \rangle \]

\[ - \frac{\partial}{\partial r_k} \langle h_i h_i h_i h_j'' \rangle - \frac{\partial}{\partial r_k} \langle h_i h_i h_i h_j'' \rangle \]
In order to write the equation (22) to spectral form, we can define the following six dimensional Fourier transforms:

\[
\langle u, u_i' \rangle = \int \langle \phi, \beta_i' \rangle \frac{d^6k}{(2\pi)^3}.
\]

By use of this facts (30) and equations (23)-(29), the equation (22) may be transformed as

\[
\frac{\partial \langle \phi, \beta_i' \rangle}{\partial t} + \lambda \left[ (1 + P_M) k^2 + (1 + P_M) k'^2 \right] + 2 P_M k k' + 2 \frac{R}{\lambda} \frac{f}{\lambda} \langle \phi, \beta_i' \rangle
\]

\[
= i(k_k + k_k') \langle \phi_i' \beta_i' \rangle - i(k_k + k_k') \langle \beta_i' \beta_i' \rangle
\]

\[
- i(k_k + k_k') \langle \phi_i' \beta_i' \rangle + i(k_k + k_k') \langle \phi_i' \beta_i' \rangle
\]

\[
+ i(k_j + k_j') \langle \gamma \beta_i' \rangle - f \langle \delta_i' \beta_i' \rangle
\]

The tensor equation (31) can be converted to scalar equation by contraction of the indices \( i \) and \( j \)

\[
\frac{\partial \langle \phi, \beta_i' \rangle}{\partial t} + \lambda \left[ (1 + P_M)(k^2 + k'^2) + 2 P_M k k' \right] + 2 \frac{R}{\lambda} \frac{f}{\lambda} \langle \phi, \beta_i' \rangle
\]

\[
= i(k_k + k_k') \langle \phi_i' \beta_i' \rangle - i(k_k + k_k') \langle \beta_i' \beta_i' \rangle
\]

\[
- i(k_k + k_k') \langle \phi_i' \beta_i' \rangle + i(k_k + k_k') \langle \phi_i' \beta_i' \rangle
\]

\[
+ i(k_j + k_j') \langle \gamma \beta_i' \rangle - f \langle \delta_i' \beta_i' \rangle
\]

To relate the terms on right hand side of equation (32) derived from the quadruple correlation terms and from the pressure force term in equation (22), we take the derivative with respect to \( x_j \) of the momentum equation (17) for the point \( p \), and combine with the continuity equation to give

\[
- \frac{\partial^2 \langle w \rangle}{\partial x_j \partial x_i} = \frac{\partial^2}{\partial x_i \partial x_k} (u_i u_k - h_i h_k)
\]

Multiplying equation (33) by \( h_i' h_i'' \) taking time averages and writing this equation in terms of the independent variables \( \hat{r} \) and \( \hat{r}' \)

\[
- \left[ \frac{\partial^2}{\partial r_j \partial r_i} + 2 \frac{\partial^2}{\partial r_j \partial r_i'} + \frac{\partial^2}{\partial r_i \partial r_i'} \right] \langle h_i' h_i'' \rangle
\]

\[
= \left[ \frac{\partial^2}{\partial r_j \partial r_i} + \frac{\partial^2}{\partial r_i \partial r_i'} + \frac{\partial^2}{\partial r_i \partial r_i'} + \frac{\partial^2}{\partial r_i' \partial r_i'} \right] \times \langle u_i u_j h_i' h_i'' \rangle - \langle h_i h_i' h_i'' \rangle
\]
Now taking the Fourier transforms of equation (34) we get
\[
-\left\langle \gamma \beta'_i \beta'_j \right\rangle = \frac{k^2 + 2k_i k_j + k^2}{(k_i k_j + k_i k_j + k_i' k_j') \left( \phi_i \phi_j \beta'_i \beta'_j - \left\langle \beta_i \beta_j \beta'_i \beta'_j \right\rangle \right)}
\]
(35)

Thus the equations (34) and (35) are the spectral equation corresponding to the three-point correlation equations. Equation (35) can be used to eliminate \( \left\langle \gamma \beta'_i \right\rangle \) from the equation (32).

**Solution for times before the final period**

It is known that equation for final period of decay is obtained by considering the two-point correlations after neglecting the 3rd order correlation terms. To study the decay for times before the final period, the three point correlations are considered and the quadruple correlation terms are neglected because the quadruple correlation terms decays faster than the lower-order correlation terms. But to get a better picture of decay of the MHD homogeneous turbulence in presence of dust particle from its initial period to its final period, three-point correlation equations are to be considered. Here, we neglect the quadruple correlation terms since the decay faster than the lower order correlation terms.

Putting the value of \( \left\langle \beta'_i \beta'_j \right\rangle \) from equation (35) into equation (32 and neglecting all the quadruple correlation terms, we have
\[
\frac{D}{Dt} \left\langle \phi_i \beta'_i \right\rangle + \lambda \left( (P + M) (k^2 + k^2) + 2PM k_i k_j \right) + \frac{2R}{\lambda} - \frac{fs}{\lambda} \left( K_i <\phi_i \beta'_i \beta'_j \right) = 0
\]
(36)

Integrating the equation (37) between to and t, and gives
\[
k_i <\phi_i \beta'_i \beta'_j = k_i (k_i + k_i') exp \left\{ \lambda \left[ (1 + P_M) (k^2 + k^2) + 2PM k_i k_i' \cos \theta + \frac{2R}{\lambda} - \frac{fs}{\lambda} \right] (t - t_0) \right\}
\]
(38)

where \( \theta \) is the angle between \( \hat{k} \) and \( \hat{k}' \) and \( \left\langle \phi_i \beta'_i \beta'_j \right\rangle \) is the value of \( \left\langle \phi_i \beta'_i \beta'_j \right\rangle \) at \( t = t_0 \).

Now, by letting \( r' \) in equation (23) and comparing with equations (12) and (13), we get
\[
<\phi_i \psi_i > = \int_{-\infty}^{\infty} <\phi_i \beta'_i (\hat{k}) \beta''_i (\hat{k}') > d\hat{k}'
\]
(39)

Substituting equation (38) - (40) in equation (16), we get
\[
\frac{D}{Dt} \left\langle \phi_i \psi'_i \right\rangle + 2\lambda [k^2 + \frac{R}{\lambda}] \left\langle \phi_i \psi'_i \right\rangle = \int_{-\infty}^{\infty} 2ik_k
\]
(41)

Now, \( d\hat{k}' \) can be expressed in terms of \( k' \) and \( \theta \) that is
\[
d\hat{k}' = -2\pi k'^2 d(cos \theta) dk'
\]

With the above relation, equation (41) to give
\[
\frac{D}{Dt} \left\langle \phi_i \psi'_i \right\rangle + 2\lambda [k^2 + \frac{R}{\lambda}] \left\langle \phi_i \psi'_i \right\rangle = \int_{-\infty}^{\infty} 2ik_k
\]
(42)
In order to find the solution completely and following (Loeffler and Deissler, 1961) we assume that

\[ \left\langle \phi, \beta'_i(\hat{k})\beta'_i(\hat{k}') \right\rangle - \left\langle \phi, \beta'_i(-\hat{k})\beta'_i(-\hat{k}') \right\rangle = 0 \]

where \( \xi_0 \) is a constant depending on the initial conditions. The negative sign is placed in front of \( \xi_0 \) in order to make the transfer of energy from small large wave numbers for positive value of \( \xi_0 \).

Substituting equation (43) into equation (42) and completing the integration with respect to \( \cos \theta \) one obtains

\[ G = \frac{-\xi_0 P_M \sqrt{\pi}}{4 \lambda^{3/2} (t-t_0)^{3/2} (1 + P_M)^{3/2}} \exp\left\{ -\frac{2R - fS}{\lambda} \right\} \]

\[ (t-t_0) \exp\left\{ -\frac{1}{\lambda (1 + P_M)} \left( 1 + \frac{5P_M^2}{v(1 + P_M)^2} - \frac{3}{2v} \right) k^2 \right\} \]

\[ k^6 + \frac{P_M}{(1 + P_M)} \left\{ \frac{P_M^2}{(1 + P_M)^2} - 1 \right\} k^8 \]  

(47)

The series of equation (42) contains only even powers of \( k^4 \) and start with and the equation represents the transfer function arising owing to consideration of magnetic field at three points at a time.

It is interesting to note that if we integrate equation (47) over all wave numbers, we find that

\[ \int_0^\infty G dk = 0 \]  

(48)

which indicates that the expression for \( G \) satisfies the condition of continuity and homogeneity.

The linear equation (45) can be solved to give

\[ H = \exp\left\{-2\lambda(k^2 + \frac{R}{\lambda})(t-t_o)\right\} \int G \exp\left\{ 2\lambda(k^2 + \frac{R}{\lambda}) \right\} \]

\[ (t-t_o) \]  

(49)

where \( J(k) = \frac{\pi N_0 k^2}{\lambda} \) is a constant of integration and can be obtained as by (Corrsin, 1951). Substituting the values of \( G \) from equation (47) in to equation (49) and integrating with respect to \( t \), we get

\[ H = \frac{N_0 k^2}{\pi} \exp\left\{-2\lambda(k^2 + \frac{R}{\lambda})(t-t_o)\right\} \]

\[ + \frac{\xi_0 \sqrt{\pi P_M}}{4 \lambda^{3/2} (1 + P_M)^{7/2}} \exp\left\{-2R - fS\right\} (t-t_o) \]

\[ \exp\left\{-\lambda k^2 \left\{ \frac{1 + 2P_M}{(1 + P_M)} \right\} (t-t_o) \right\} \times \left\{ \frac{3P_M^2 k^4}{2 \lambda^2 P_M (t-t_o)^{5/2}} \right\}. \]
Where

\[ N(\omega) = e^{-\omega^2} \int_0^\omega e^{\gamma^2} d\gamma, \quad \alpha = k \sqrt{\frac{\lambda(t-t_o)}{(1+p_M)}}. \]

By setting \( \tilde{f} = 0, \quad j = i, \quad d\tilde{K} = -2\pi k^2 d(\cos \theta)d\tilde{k} \) and \( H = 2\pi k^2 \langle \psi_i \psi_j \rangle \tilde{K} \) in equation (9), we get the expression for magnetic energy decay with the fluctuating concentration as

\[ \frac{\langle h^2 \rangle}{2} = \frac{\langle h_i h_i \rangle}{2} = \int_0^\infty H d\tilde{k} \]

Substituting equation (50) in to (51) and after integration with respect to \( k \), we get

\[ \frac{\langle h^2 \rangle}{2} = \exp[-2R(t-t_0)] \left[ \frac{N_o (t-t_o)^{-\frac{3}{2}}}{8\lambda^{\frac{3}{2}}\sqrt{2\pi}} + \exp[fs] \frac{\xi_0 \pi (t-t_o)^{-5}}{4\lambda^6 (1+p_M)(1+2p_M)} \right] \]

\[ \times \left[ \frac{9}{16} \frac{5p_M (7p_M - 6)}{16(1+2p_M)} - \frac{35p_M (3p_M^2 - 2p_M + 3)}{8(1+2p_M)^2} + \frac{8p_M (3p_M^2 - 2p_M + 3)}{3.2^6(1+2p_M)^3} \sum_{n=0}^{\infty} \frac{1.3.5...(2n+9)}{n!(2n+1)^2(1+p_M)^n} \right] \]

or

\[ \frac{\langle h^2 \rangle}{2} = \exp[-2R(t-t_0)] \left[ \frac{N_o (t-t_o)^{-\frac{3}{2}}}{8\lambda^{\frac{3}{2}}\sqrt{2\pi}} + \exp[fs] \frac{\xi_0 Z(t-t_o)^{-5}}{4\lambda^6 (1+p_M)(1+2p_M)} \right] \]

where

\[ Z = \frac{\pi}{(1+p_M)(1+2p_M)^{\frac{5}{2}}} \]

Thus the decay law for magnetic energy fluctuation of dusty fluid MHD turbulence governing the concentration of a dilute contaminant undergoing a first order chemical reaction before the final period may be written as

\[ \langle h^2 \rangle = \exp[-2R(t-t_0)] \left[ A(t-t_0)^{-\frac{3}{2}} + \frac{9}{16} \frac{5p_M (7p_M - 6)}{16(1+2p_M)} - \frac{35p_M (3p_M^2 - 2p_M + 3)}{8(1+2p_M)^2} + \frac{8p_M (3p_M^2 - 2p_M + 3)}{3.2^6(1+2p_M)^3} \right] \]

Results and Discussion

In equation (53) we obtained the decay law for magnetic energy fluctuation of dusty MHD turbulence governing the concentration of a dilute contaminant undergoing a first order chemical reaction before the final period considering three-point correlation after neglecting quadruple correlation terms. If the the fluid is clean, i.e. \( f=0 \) then the equation (53) becomes

\[ \langle h^2 \rangle = \exp[-2R(t-t_0)] \left[ A(t-t_0)^{-\frac{3}{2}} + B(t-t_o)^{-5} \right] \]

which was obtained earlier by (Sarker and Islam, 2001)

In absence of chemical reaction, i.e, \( R=0 \) then the equation (54) becomes

\[ \langle h^2 \rangle = \left[ A(t-t_o)^{-\frac{3}{2}} + B(t-t_o)^{-5} \right] \]

which was obtained earlier by (Sarker and Kishore, 1991).

Conclusion

This study shows that due to the effect of dust particles in the magnetic field with chemical reaction of the first order in the concentration the magnetic field fluctuation i.e. the turbulent energy decays more rapidly than the energy for clean fluid and the faster rate is governed by. Here the chemical reaction \( R\neq0 \) in dusty fluid MHD turbulence causes the concentration to decay more they would for clean fluid and it is gov-
The first term of right hand side of equation (53) corresponds to the energy of magnetic field fluctuation of concentration for the two-point correlation and the second term represents magnetic energy for the three-point correlation. In equation (53), the term associated with the three-point correlation dies out faster than the two-point correlation. For large times the last term in the equation (53) becomes negligible, leaving the -3/2 power decay law for the final period. If higher order correlations are considered in the analysis, it appears that more terms of higher power of time would be added to the equation (53).
