Correction of the malocclusion was accomplished. However, in order to maintain the torque control was maintained while the mandibular finally the over bite and over jet was normal. Good established with good alignment of the teeth. Some asymmetries. A full complement of permanent teeth achieved. Class I canine relationships were may be faced as an important part of treatment and as the major problem. The patient was happy with the new appearance of the teeth.}

**Treatment Results:**

The skeletal Class III malocclusion was characterized by mandibular prognathism, maxillary deficiency or both.1,3 The effect of the overjet and overbite can worsen the prognosis recognizing the importance of the frontal and dental interdigitations (0.016 x0.022 inch arch wire).
