Effectiveness of Aloe Vera Gel in Management of Superficial Burn in Children
Md. Saif Ullah\textsuperscript{1}, Md. Mazharul Alam\textsuperscript{2}, Kazi Md. Noor-ul Ferdous\textsuperscript{3}

Abstract

Background: Aloe vera has been used traditionally for healing burn and inflammation. Though, the evidence for the effectiveness of aloe vera for healing burn is not sufficient.

Objective: The aim of this study was to assess the effectiveness of aloe vera gel in management of superficial burn in children.

Methods: This retrospective study was taken place in the Department of Burn and Reconstructive Surgery, Bangladesh Shishu Hospital & Institute, Dhaka and other two privet clinics at Dhaka, from September, 2019 to March, 2022. Total 47 patients with superficial partial thickness burn was included in the study.

Results: In this study, majority (48.94\%) patients were belonged to the age group of \(\leq24\) months. The mean age was found 38.9±26.31 months. The current study observed that almost two third (61.70\%) patients were male. In our study, majority (63.83\%) patients stayed hospital for 1-5 days. In the present study, mean (±SD) pain relief time was 3.56±1.24 days and mean (±SD) wound healing time was found 8.19±1.6 days. The current study observed that only 3(6.38\%) patients had found wound infection. In current study showed that mean treatment cost was found 76.46±31.88 Taka.

Conclusion: Aloe vera gel facilitated early pain alleviation, wound healing, and cost-effective superficial burn treatment in children. Therefore, it can be utilized to treat superficial burns in children to get better results.

Keywords: Aloe vera gel, children, superficial burn.

Introduction

Aloe vera is being used for centuries for “cosmetic, medicinal, and nutraceutical purposes” due to its antioxidant properties.\textsuperscript{1} It has 75 potentially active ingredients, including amino acids, carbohydrates, lignin, saponins, vitamins, enzymes, minerals, and salicylic and other acids.\textsuperscript{2} The extract of aloe vera gel allowed for quicker healing of burns and restored the vascularity of burn tissues. These effects could be the result of a number of mechanisms, such as an increase in the production of collagen and the rate of epithelialization brought on by the ability of acemanan (mannose-6 phosphate) to stimulate fibroblasts, as well as an anti-inflammatory, antimicrobial, and moisturizing effect (Maenthaisong et al. 2007).\textsuperscript{3} One of the main benefits of using aloe vera gel in many nations is the healing of burn wounds.\textsuperscript{4-5} Burns have been identified as one of the most damaging types of child damage in terms of functional, social, and psychological impact.\textsuperscript{6-9} Burns
are a major cause of public health concern and are an international issue.\textsuperscript{10} In 2000, there were 238,000 fire-related fatalities worldwide, 95% of which were in low- and middle-income nations.\textsuperscript{11} Aloe vera has been shown by Davis RH\textsuperscript{12} to relieve pain, inflammation, arthritis, and wounds. His conductor-orchestra theory of aloe vera considers how all of its biologically active components work together to deliver the maximum amount of desired effects with little to no toxicity. Athavale et al\textsuperscript{13} evaluated the percentage decrease of wound healing with aloe vera gel dressing and contrasted its efficacy with that of traditional dressing (normal saline and povidone iodine). According to the study’s findings, aloe vera gel is very successful in treating chronic ulcers and accelerates wound healing, which shortens hospital stays. Aloe vera gel was not linked to any adverse reactions or infections. According to Varaei et al\textsuperscript{14}, local burn wound pain was measured using a visual analogue scale 10 minutes before to changing the dressing and 24, 48, and 72 hours afterwards using 2% nitrofurazone ointment and aloe vera gel. Thus, dressing pain intensity considerably decreased over the course of 72 hours in both locations, but aloe vera gel was able to lessen pain more quickly than nitrofurazone. The cause might be the carboxypeptidase found in aloe vera gel, which interacts with bradykinin, a potent cause of acute inflammatory pain.\textsuperscript{15} Aloe vera use is also reasonably priced. Aloe vera is thought to function by boosting the turnover, production, and cross-linking of collagen in the healing wound.\textsuperscript{16-18} By inhibiting leukocyte adherence and the activities of Transforming Necrosis Factor and Interleukin-6, it may also suppress the inflammatory process.\textsuperscript{19} However, the effectiveness of aloe vera gel in management of superficial burn in children has not been previously studied in depth. Therefore, the current study was conducted to evaluate the effectiveness of aloe vera gel in management of superficial burn in children.

\textbf{Materials and Methods}

This retrospective study was taken place in the Department of Burn and Reconstructive Surgery, Bangladesh Institute of Child Health (BICH), Dhaka Shishu (Children) Hospital and other two privet clinics at Dhaka, from September, 2019 to March, 2022. Total 47 patients’ data collected from hospital records who admitted with superficial partial thickness burn involving <20% of TBSA (total body surface area) admitted within 24 hours during the study period and treated with aloe vera gel. Hospital records confirmed that, burn involving special areas (face, palm, sole, and perineum), burn associated other injuries, electric and chemical burn, patients with known allergy to aloe vera gel were excluded. An informed written consent of the guardians were taken before starting the treatment. Statistical analysis was carried out using the Statistical Package for Social Sciences version 23.0 for Windows (SPSS Inc., Chicago, Illinois, USA). The quantitative observations were indicated by frequencies and percentages.

\textbf{Results}

In this study, majority (48.94\%) patients were belonged to the age group of ≤24 months. The mean age was found 38.9±26.31 months. The current study observed that almost two third (61.70\%) patient were male (Table I). Majority (63.83\%) patients stayed hospital for 1-5 days (Table II). Mean (±SD) pain relief time was 3.56±1.24 days and mean (±SD) wound healing time was found 8.19±1.6 days (Table III). Fig. 1 demonstrates the distribution of the study population according to wound infection using Aloe vera gel. The current study observed that only 3(6.38\%) patients had wound infection. Mean treatment cost was found 76.46±31.88 Taka (Table IV).

Discussion
This study observed that majority (48.9%) patients were belonged to age ≤24 months. The mean age was found 38.9±26.31 months. Jozsa et al\textsuperscript{20} reported most of the studied children were <5 years of age. Up to 50% of children under the age of 11 get sunburns, which are the most frequent and avoidable kind of burns.\textsuperscript{21} Children of five years of age or younger most frequently get scald burns, which are frequently caused by spilling hot liquids while cooking.\textsuperscript{22} The current study observed that almost two third (61.70%) patients were male. In the study of Shahzad et al\textsuperscript{23}, 68.0% patients were male in aloe group. In our study, majority (63.83%) patients stayed hospital for 1-5 days. In this present study, mean (±SD) pain relief time was 3.56±1.24 days and mean (±SD) wound healing time was found 8.19±1.6 days. In a study conducted in Bangladesh by Alam et al\textsuperscript{24}, mean pain relief time was found 2.60±1.27 days and the mean wound healing time was found 5.15±1.56 days. Thamlikitkul et al\textsuperscript{25} used Aloe fresh mucilage in 38 patients with thermal burn and found that the healing process was accelerated significantly. In 1995, Visuthikosol et al\textsuperscript{26} published the results of a research on 27 patients who had partial thickness burn wounds that were either dressed with gauze soaked in Aloe vera gel or left untreated. They noticed that patients who received aloe treatment had considerably faster wound healing times (11.19 days). The aloe-treated patients’ wound healing times were dramatically shortened (18.9 days) in the study of Akhtar and Hatwar\textsuperscript{27}. Shahzad et al\textsuperscript{23} in their study found that the time taken for partial thickness burns to heal was significantly shorter with aloe vera compared to control group (11±4.18 days vs. 24.24±11.16 days). Walash et al\textsuperscript{28} compared the effectiveness of aloe vera gel dressing to traditional dressing on the recovery process and pain levels in burn patients. Compared to the control group, the research group experienced a quicker healing process, less discomfort, and a shorter hospital stay after using an Aloe Vera gel dressing. The current study observed that only 3(6.38%) patients had wound infection. This finding is similar to the study of Alam et al\textsuperscript{24}, where the rate of wound infection was 5%. According to Shahzad et al\textsuperscript{23}, the sole mechanism supporting the ongoing usage of silver sulphadiazine in burn injuries is its antibacterial action. The topical administration of SSD may result in leukopenia, renal damage, or both. In reality, while treating major wounds, severe negative effects have been noted.\textsuperscript{25,29,30} In the study of Walash et al\textsuperscript{28}, while 48% of the control group’s patients exhibited signs of wound infection during the last two evaluations, all trial participants were free of these symptoms throughout the fifth and sixth assessments. In current study showed that mean treatment cost was found 76.46±31.88 Taka which is very cost effective compared to chemical products.
Conclusion
Aloe vera gel facilitated early pain alleviation, wound healing, and cost-effective superficial burn treatment in children. Therefore, it can be utilized to treat superficial burns in children to get better results. This research recommends using aloe vera gel to treat children’s superficial burns, and the outcomes were encouraging. Further study is required with larger sample size in the fascinating topic of burn wound treatment for better understanding.
