A 26-year-old man presented with gradual swelling of both legs for the last 5 years (Figure 1). The skin over the legs are thickened, with irregular nodular swelling. He also complained of significant weight loss in past few months, together with frequent passage of loose stool, sweating and palpitation. Patient was previously treated by Diethylcarbamazine as a case of Filariasis.

On examination the patient was anxious with a staring look and mildly anaemic. There was clubbing (Figure: 2) in digits of hands and feet, tachycardia, irregular nodular non tender and firm goitre with no bruit or retrosternal extension, warm and moist palm, fine tremor. There was bilateral non pitting oedema of the legs (Figure: 3) and overlying skin is thick, irregular, nodular. There is no organomegaly, ascites or lymphadenopathy. There was exophthalmus, but no diplopia, ophthalmoplegia, lid lag or lid retraction.

His thyroid profile revealed TSH - 0.00 mIU/L, F-T4 - 30.27 pmol/L, F-T3 - 16.51 pmol/L, Anti-Thyroglobulin Ab - 1.66 IU/ml

The patient was diagnosed with Thyrotoxicosis due to Graves disease with Thyroid acropachy with Dermopathy. This atypical nodular dermopathy is a rare presentation in Graves diseases.
