Antidiarrhoeal Activity and Total Tannin Content of Ethanolic Leaf Extract of *Codiaeum variegatum*

Department of Pharmacy, World University of Bangladesh, Dhaka-1205, Bangladesh

Received: September 15, 2014; Accepted: May 20, 2015; Published (web): June 15, 2015

**ABSTRACT:** The present study was designed to investigate the antidiarrhoeal activity and determine the total tannin content of the ethanolic extract of the leaves of *Codiaeum variegatum* (Family- Euphorbiaceae). The antidiarrhoeal activity was evaluated in castor oil-induced diarrhoea in mice and the total tannin content was determined by using the Folin-Ciocalteu phenol reagent. The ethanolic extract of leaves of *C. variegatum* showed a positive effect on castor oil induced diarrhoea in mice. In the antidiarrhoeal assay the extract inhibited the mean number of defecation by 40.81% and 59.18% (p<0.01 & p<0.001) at 250 mg/kg and 500 mg/kg body weight, respectively. The latent period for the extract treated group was (p<0.01 & p<0.001) increased as compared to control group. The total tannin content was quite significant and high in ethanolic extract (241.41 mg/g of tannic acid equivalent). Phytochemical screenings of the leaf extract indicated the presence of carbohydrate (reducing sugars), gums, steroids, alkaloids and tannins. Therefore, the results of the present study provide the scientific basis for the traditional uses of this plant as remedy for diarrhea.

**Key words:** *Codiaeum variegatum*, antidiarrhoeal, total tannin content, phytochemical screening

**INTRODUCTION**

Bangladesh possesses rich floristic wealth and diversified genetic resources of medicinal plants. The use of the plants, plant extracts and pure compounds isolated from natural sources provided the foundation for pharmacologically active compounds for drug discovery. *C. variegatum* belonging to the family Euphorbiaceae is one of the common medicinal plants grown in Indian subcontinent. Different parts of this plant have been used in traditional medicines.

*C. variegatum*, commonly known as Croton or Joseph's Coat, is one of the most popular ornamental plants because of vivid foliage colors and varied leaf shapes. *C. variegatum* is native to Indonesia, Malaysia, Philippines, India, Thailand and Sri Lanka. It is an evergreen shrub, up to 6 m in height but usually maintained at 60-90 cm and grows well in areas having humid climate. More than 200 varieties of croton exist on the globe, available in different leaf sizes, shapes and color patterns. Young leaves are usually green, bronze, yellow, or red, later changes to gold, cream, white, scarlet, pink, maroon, purple, black or brown. Sometimes totally different forms of leaves and color variations occur on the same plant. Flowers are small, long, axillary, usually unisexual racemes. Fruits are globular capsules and 3-8 mm in diameter.

In addition to its esthetic value as an indoor plant, crotons are also well known for its medicinal value. The leaf extracts of crotons are reported to have many medicinal properties including purgative, sedative, antifungal, antiamoebic and anticancerous activities. The plant is also well reputed for the production of valuable secondary metabolites of alkaloids, terpenes and flavonoids in nature.

**MATERIALS AND METHODS**

**Collection and identification of plant material.** The leaves of *C. variegatum* were collected from Khulna University, Khulna, Bangladesh. A specimen
copy was deposited to Bangladesh National Herbarium for identification & the accession number was DACB-34739.

**Preparation of ethanolic extract.** The collected plant part (leaves) was separated from undesirable materials and then were washed with water and air-dried under shed followed by drying in an electric oven at 40 °C. The dried leaves were ground into powder with the help of a suitable grinder (Capacitor start motor, Wuhu motor factory, China). The powder was stored in an airtight container and kept in a cool, dark and dry place. About 500 g of powered material was taken in a clean, flat-bottomed glass container and soaked in 1.5 litre of 80% ethanol. The container with its contents was sealed and kept for a period of 6 days accompanying occasional shaking and stirring. The whole mixture then underwent a coarse filtration by a piece of clean, white cotton material. Then it was filtered through Whatman filter paper (Bibby RE200, Sterilin Ltd., UK) and the filtrate was concentrated with rotary evaporator (Buchi, Switzerland) at a bath temperature not exceeding 40 °C to have gummy concentrate extract (yield approx. 6.2%).

**Test for different chemical groups.** The freshly prepared crude extract was qualitatively tested for the presence of chemical constituents. For example, alkaloids were identified by the Dragendorff’s reagent, flavonoids with the use of Mg and HCl, tannins with ferric chloride and potassium dichromate solutions, and steroids with Liebermann-Burchard reagent. Reducing sugars with Benedict’s reagent.

**Test for antidiarrhoeal activity**

**Test animals & drugs.** White albino mice (Swiss-wistar strain, body weight: 20-25 gm) of both sexes were used for in vivo antidiarrhoeal activity. They were housed in standard environmental conditions at animal house of Pharmacology Laboratory, BCSIR, Chittagong, Bangladesh. Animals were kept under standard environmental conditions (temperature: (24.0 ± 1.0 °C), relative humidity: 55-65% and 12 hr light/12 hr dark cycle) and had free access to food and water. The cages were cleaned once daily. This study was carried out following approval from the ethical committee comprising pharmacologist and toxicologist expert on the use and care of animals of the BCSIR. Loperamide (Square Pharmaceuticals Ltd., Bangladesh) was used as standard drug for this study.

**Chemicals.** Folin- coicalteu phenol reagent and tannic acid were obtained from Sigma Chemical Co. (St. Louis, MO, USA). Tween 80 and sodium carbonate were of analytical grade and purchased from Merck (Darmstat, Germany).

**Castor oil-induced diarrhoea.** Antidiarrhoeal activity of leaf extract of *C. variegatum* was tested by using castor oil induced method in mice. Twenty swiss albino mice were randomly divided in to four groups (n = 5). Control group received only distilled water 2 ml/mice, positive control group received loperamide 50 mg/kg body weight as standard and test groups received the extracts at the doses of 250 mg and 500 mg/kg body weight. Mice were housed in separate cages having paper placed below for collection of fecal matters. Diarrhea was induced in the mice by oral administration of castor oil (1.0 ml/mice). Extract and drugs were given orally 1 hour before the administration of castor oil. The time for first excretion of feces and the total number of fecal output by the animals were recorded. Normal stool was considered as numerical value 1 and watery stool as numerical value 2. Percent inhibition of defecation in mice was calculated by using the following equation: % inhibition = [(Mo–M)/Mo] x100; where, Mo = Mean defecation of control and M = Mean defecation of test sample.

**Total tannin content determination.** The tannins were determined using the Folin- coicalteu phenol reagent as reported by Amorim. Briefly, 0.1 ml of the sample extract was added to 7.5 ml of distilled water and 0.5 ml of Folin-coicalteu phenol reagent, 1 ml of 35% sodium carbonate solution and diluted to 10 ml with distilled water. The mixture was shaken well, kept at room temperature for 30 min and absorbance was measured at 725 nm with a double beam Analykjenia UV/Visible spectrophotometer.
Antidiarrhoeal Activity and Total Tannin Content

Total tannin content was determined as mg of tannic acid equivalent per gram using the equation obtained from a standard tannic acid calibration curve with intercept (C) = -0.2583, slope (m) = 4.5692 and regression coefficient $r^2 = 0.9953$.

**Results and Discussion**

**Chemical Group Test.** Results of different chemical tests on the ethanolic extract of leaves of *C. variegatum* showed the presence of reducing sugar, tannins, steroid & alkaloid (Table 1).

**Test for Antidiarrheal Activity.** Table 2 showed the effect of the ethanolic extract of leaves of *C. variegatum* on castor oil-induced diarrheal activity in mice. The result showed that the extract reduced the mean number of defection which were 40.81% and 59.18% (P<0.01 & P<0.001) at the doses of 250 mg/kg and 500 mg/kg respectively. The latent period for the extract treated group was (P<0.01 & P<0.001) increased as compared to control group.

Diarrhoea results from an imbalance between the absorptive and secretory mechanisms in the intestinal tract, accompanied by hurry, resulting in an excess loss of fluid in the faeces. In some diarrheas, the secretory component predominants, while other diarrheas are characterized by hypermotility. The use of castor oil induced diarrheal model in our study is logical because the autacoids and prostaglandins are involved in producing diarrhoea in human. The liberation of ricinolic acid from castor oil results in irritation and inflammation of the intestinal mucosa, leading to release of prostaglandins, which stimulate motility and secretion. These observations suggest that those extracts at a dose of 250 mg/kg & 500 mg/kg reduced diarrhoea by inhibiting castor oil induced intestinal accumulation of fluid.

Phytochemical screening revealed the presence of reducing sugar, tannin, steroid & alkaloid. Earlier
studies showed that anti-dysenteric and antidiarrhoea properties of medicinal plants were due to tannins, alkaloids, saponins, flavonoids and sterols.15,16 Again, tannins and phenoics present in the plant extract are reported to inhibit release of autacoids and prostaglandins, thereby inhibit motility and secretion induced by castor oil.17

Hence, tannins, steroid & alkaloid may be responsible for anti-diarrhoeal activity of C. variegatum leaves.

CONCLUSION

The present study demonstrates that the ethanol extract of C. variegatum leaves contains tannins and other pharmacologically active substance(s) possessing significant antidiarrhoeal activity. The present data provided a scientific support for the traditional use of this plant as diarrhoeal remedy. However, more detailed phytochemical analysis will be necessary to isolate and characterize the active compounds responsible for the antidiarrhoeal activities as well as to understand the exact mechanisms of action of these activities.
