Study of Thyroid Hormone Status in Normal Newborn and Preterm, Low Birth Weight Baby

Iqbal T1, Ali MOI2, Atia NE3, Islam T4

Abstract

Background: Screening for thyroid hormones in the newborn baby is extremely important to detect the newborns who are borned with hypofunctional state of thyroid gland. This screening program in first few weeks of life is essential to prevent serious complications of hypothyroidism in future such as mental retardation.

Objective: To assess the thyroid hormone levels in normal newborn and preterm, low birth weight babies and comparison of thyroid dysfunction between these two groups.

Method: This cross-sectional analytical type of study was conducted in the department of physiology and paediatrics of Rajshahi Medical College & Hospital (RMCH) from July 2015 to June 2016. A total of 70 newborn baby were enrolled by systematic sampling of which 40 were normal healthy newborn and 30 were preterm, low birth weight babies. Data was collected from the parents and they were filled out standard questionnaire. Then venous blood was collected from each and every neonate and blood was sent to laboratory for estimation of thyroid hormone levels. FT4 and TSH values were estimated as these two are the most important parameters for determination of thyroid function.

Result: In this study, the mean (±SD) serum FT4 level in term and preterm neonates were 14.17±2.14 and 12.25±3.16 (pg/ml) respectively. This FT4 value is significantly higher in term neonates than preterm neonates (P<0.05). The mean (±SD) serum TSH level in term and preterm neonates were 3.37±2.12 and 4.23±3.23 (µIU/ml) respectively. Statistically there was no significant difference in TSH values between these two groups (P ≥ 0.05).

Conclusion: From this study it was evident that preterm, low birth weight babies are more likely to develop hypofunctional state of thyroid gland than normal term babies. The newborns who were found hypothyroid, were informed to their parents for consultation with the concerned physicians. The physicians then took necessary steps to correct the hypofunctional state of thyroid gland.

Key words: Serum thyroid hormone levels, Normal term babies and preterm, Low birth weight babies.

Introduction

Newborn screening for congenital hypothyroidism is one of the major achievements in preventive medicine. Congenital hypothyroidism (CH) is one of the common causes of irreversible mental and physical disability if undetected in the neonatal period. Congenital hypothyroidism (CH) is the most common congenital metabolic disorder seen in the newborns (1 in 4,000 births). It causes irreversible mental and physical disability if remains undetected or untreated. Diagnosis and treatment of CH before 3 months are mandatory to avoid cretinism. Low birth weight (LBW) babies are those whose birth weight is less than 2.5 kg. It has two types: Preterm baby (Babies which are born before 37th weeks of gestation) and small for gestational age baby. Preterm newborn babies are more likely to

newborns and preterm, low birth weight babies and comparison of thyroid status between these two groups. It will facilitate the early detection of hypofunctional state of thyroid gland and thus treat accordingly. In this way, this study contributed in reducing infant and childhood morbidity.

**Methods**

This cross-sectional analytical type of study was carried out in the department of Physiology and department of Paediatrics of Rajshahi Medical College Hospital (RMCH) between the period of July 2015 to June 2016. The protocol of this study was approved by Institutional Review Board (IRB) of Rajshahi Medical College. 70 newborn babies were selected between the age group 5 to 28 days, among which 40 were normal healthy newborn and 30 were preterm, low birth weight newborn. Study subjects were selected by systematic sampling in Rajshahi Medical College Hospital. All the subjects were free from birth asphyxia, meningitis, septicaemia and other serious neonatal diseases. The aim, benefit and procedure of the study were explained to the parents of the newborns and their informed written consents were taken. Data was collected from face to face interview with the parents and they were filled out standard questionnaire. Then with all aseptic precaution, venous blood was collected from the newborn babies and sent to the laboratory for estimation of thyroid hormone levels. Serum FT4 and TSH levels were measured by ELISA (Enzyme linked immuno sorbent assay) method. Statistical significance was determined by 'unpaired t test' at probability level of 0.05.

**Results**

Results of this study shows that among 40 normal healthy term newborns, 38 (95%) of them has normal FT4 and TSH level. Only 2 (5%) babies were found to be hypothyroid (low FT4 and high TSH). On the other hand among 30 preterm, low birth weight babies 6 (20%) of them were found to be hypothyroid. The mean (± SD) serum FT4 level in term and preterm neonates were 14.17±2.14 and 12.25±3.16 (pg/ml) respectively (Table I).

**Discussion**

Thyroid hormones screening in the neonatal period is essential to detect the hypofunctional state of thyroid gland. Most neonates born with congenital hypothyroidism (CH) have normal appearance and no detectable physical signs. Hypothyroidism in the newborn period is almost always overlooked and delayed diagnosis leads to the most severe outcome of CH, mental retardation, emphasizing the importance of newborn screening. In developed countries, this screening program was initiated in the last century and now it is well established. But in developing countries like Bangladesh, this screening program for thyroid status in newborn is a new concept. In this study, total 70 neonates were included out of which 40 were normal, term baby and 30 were preterm, low birth weight baby. In first 2 to 3 days of life, there occurs TSH surge in the newborn baby due to neonatal cooling. It causes raised thyroid hormone level (T3 & T4). To exclude this phenomenon, blood was collected from 5th day onwards from the newborn baby. In this study, the mean (±SD) serum FT4 values in term and preterm babies were 14.17±2.14 and 12.25±3.16 (µIU/ml) respectively. This FT4 value is significantly higher in term babies than preterm babies (P< 0.05). This result is similar to the study performed by Carrascosa A, Ruiz- Cuevas P, Potau N, Almar J in 2004. They measured FT4 level in 75 preterm, newborn baby and later compared this value with term baby. The FT4 level was found higher in term babies than preterm counterpart. In my study, mean FT4 level in < 36 weeks, 36-40 weeks and > 40 weeks gestational age group newborn were 12.13, 13.9 and 15.21 µIU/ml respectively. It was evident that mean FT4 level declines in relation to prematurity. This result can be compared with the study performed by Mercado M, Yu VY, Francis I & Gold H in 1988. They measured thyroid function test in 108 premature infants and they divided premature infants into two groups : 23-28 weeks and 29-31 weeks of gestation. Infants of 23-28 weeks of gestation had significantly lower T3, T4 values compared to those of 29-31 weeks of gestation.

In this study, mean serum TSH values in 2000-2500 gram and > 2500 gram newborns were 3.12 and 3.69 (µIU/ml) respectively. So it was evident that TSH elevation was attenuated in low birth weight infants. This result can be compared with the study performed by Tylek- Lemanska D, Kopice M & Starzyk J in 2005.

**Conclusion**

From this study it was evident that preterm neonates are more likely to develop hypofunctional state of thyroid gland than normal term neonates. The newborns who were found hypothyroid, were informed to their parents for consultation with the concerned physicians. The physicians then took necessary steps to correct the hypofunctional state of thyroid gland. In this way this study contributed in preventing serious complications of hypothyroidism in future.
