Abstract:
Anthropometry is the science that deals with the measurement of size, weight and proportion of the human body. Stature or body height is one of the most important and useful anthropometric parameter that determine the physical identity of an individual. The study was done to estimate stature from the arm span on one hundred and fifty Bengali adult Muslim females. Subject was collected from Bangabandhu Sheikh Mujib Medical University, Dhaka and some urban region of Dhaka. The present study showed significant (p<0.001) positive correlation between the stature and the arm span.

Introduction:
Stature are natural heights of a person in an upright position. this can be estimated from arm span1. The arm-span frequently used as a basis for estimating age-related loss in stature and as an alternative measure to stature when stature cannot be measured directly due to deformity like kyphosis, lordosis and scoliosis, contracture or missing legs. In these cases the original stature of those people can be estimated by multiplying the dimension of arm span of those sexes or ethnic groups with respective multiplication factor. The multiplication factor can be obtained by making ratio of the stature to the arm span.

Materials and methods:
The study was predominantly descriptive cross sectional study with some analytical components. It was done on one hundred and fifty Bengali adult Muslim females, 25-30 years approximate by age.2 Measurement of the stature was taken with a standard anthropometer. The stature was measured as the vertical distance from the vertex to the floor. Measurement was taken by making the subject stand erect on a horizontal resting plane bare footed having the palms of the hands turned inwards and the fingers pointing downwards. Then, the movable piece of the anthropometer was brought in contact with the vertex in the mid sagittal plane. A 3 meter long steel measuring tape was employed for arm-span measurement and the reading was taken to the nearest 0.1cm. The arm-span was measured while the subject stood erect looking straight ahead with the back against the wall for support. The arms were out stretched at right angles to the body in the coronal plane with the palms facing forwards. The measurement was taken from one middle fingertip to the other middle fingertip, with the tape passing in front of the clavicles. The measurement was recorded in centimeter to the nearest 0.1 cm.

Results:
The present study showed positive correlation (p value <0.001) between the stature and arm span. The mean stature and mean arm-span were 156.02 (±6.13) cm and 160.14 (±5.41) cm respectively among Bengali adult Muslim female. The stature and other measurements are shown in Table 1.1 along with the multiplication factors used to estimate the stature from these measurements. The table also shows the correlation coefficients (r) and p values to reveal the relationships between specific measurements and stature.

Table 1.1 Stature and measurements of the arm span, the multiplication factors for estimating stature from the arm span measurements and correlation of these measurements with stature.

</tbody>
</table>

The measured stature ranged from 140.70 to 168.85 cm with a mean (±SD) of 154.68 (±5.05) cm.
N = 150 NS = Non-significant.
In the present study there was a significant (p<0.001) positive correlation between the stature and arm span (Figures 1.01, 1.02).

Discussion:

In the present study the mean stature was 156.02 (±6.13) cm and the mean arm span was 160.14 (±5.41) cm. The mean multiplication factor was 0.97 From the present study we found some multiplication factor. Multiplying these multiplication factors with the arm span we found some estimated statures which were correlate with the measured stature. All the measurements in this study were a positive as well as a statistically significant correlation with the stature.

Conclusion:

From the present study we found some multiplication factors which were helpful for Bengali adult Muslim females for estimation of stature from respective arm span. That may be helpful for those who work in this area especially in the various medical disciplines, anthropologists, beauticians, nutritionists and security experts of Bangladesh.
